1 Spring 2020

1.1 1

Concepts used:

- DCT
- Weierstrass Approximation Theorem

Solution:

- Suppose p is a polynomial, then

$$\begin{aligned}
 \lim_{k \rightarrow \infty} \int_0^1 kx^{k-1}p(x) dx &= \lim_{k \rightarrow \infty} \int_0^1 \left(\frac{\partial}{\partial x} x^k \right) p(x) dx \\
 &= \lim_{k \rightarrow \infty} \left[x^k p(x) \Big|_0^1 - \int_0^1 x^k \left(\frac{\partial}{\partial x} p(x) \right) dx \right] \quad \text{integrating by parts} \\
 &= p(1) - \lim_{k \rightarrow \infty} \int_0^1 x^k \left(\frac{\partial}{\partial x} p(x) \right) dx,
 \end{aligned}$$

- Thus it suffices to show that

$$\lim_{k \rightarrow \infty} \int_0^1 x^k \left(\frac{\partial}{\partial x} p(x) \right) dx = 0.$$

- Integrating by parts a second time yields

$$\begin{aligned}
\lim_{k \rightarrow \infty} \int_0^1 x^k \left(\frac{\partial}{\partial x} p(x) \right) dx &= \lim_{k \rightarrow \infty} \frac{x^{k+1}}{k+1} p'(x) \Big|_0^1 - \int_0^1 \frac{x^{k+1}}{k+1} \left(\frac{\partial^2}{\partial x^2} p(x) \right) dx \\
&= - \lim_{k \rightarrow \infty} \int_0^1 \frac{x^{k+1}}{k+1} \left(\frac{\partial^2}{\partial x^2} p(x) \right) dx \\
&= - \int_0^1 \lim_{k \rightarrow \infty} \frac{x^{k+1}}{k+1} \left(\frac{\partial^2}{\partial x^2} p(x) \right) dx \quad \text{by DCT} \\
&= - \int_0^1 0 \left(\frac{\partial^2}{\partial x^2} p(x) \right) dx \\
&= 0.
\end{aligned}$$

- The DCT can be applied here because f'' is continuous and $[0, 1]$ is compact, so f'' is bounded on $[0, 1]$ by a constant M and

$$\int_0^1 |x^k f''(x)| \leq \int_0^1 1 \cdot M = M < \infty.$$

- Now use the Weierstrass approximation theorem:
 - If $f : [a, b] \rightarrow \mathbb{R}$ is continuous, then for every $\varepsilon > 0$ there exists a polynomial $p_\varepsilon(x)$ such that $\|f - p_\varepsilon\|_\infty < \varepsilon$.
- Thus

$$\begin{aligned}
\left| \int_0^1 kx^{k-1} p_\varepsilon(x) dx - \int_0^1 kx^{k-1} f(x) dx \right| &= \left| \int_0^1 kx^{k-1} (p_\varepsilon(x) - f(x)) dx \right| \\
&\leq \left| \int_0^1 kx^{k-1} \|p_\varepsilon - f\|_\infty dx \right| \\
&= \|p_\varepsilon - f\|_\infty \cdot \left| \int_0^1 kx^{k-1} dx \right| \\
&= \|p_\varepsilon - f\|_\infty \cdot x^k \Big|_0^1 \\
&= \|p_\varepsilon - f\|_\infty \xrightarrow{\varepsilon \rightarrow 0} 0
\end{aligned}$$

and the integrals are equal.

- By the first argument,

$$\int_0^1 kx^{k-1} p_\varepsilon(x) dx = p_\varepsilon(1) \text{ for each } \varepsilon$$

- Since uniform convergence implies pointwise convergence, $p_\varepsilon(1) \xrightarrow{\varepsilon \rightarrow 0} f(1)$.

1.2 2

Concepts used:

- Definition of outer measure: $m_*(E) = \inf_{\{Q_j\} \Rightarrow E} \sum |Q_j|$ where $\{Q_j\}$ is a countable collection of closed cubes.
- Break \mathbb{R} into $\prod_{n \in \mathbb{Z}} [n, n+1)$, each with finite measure.
- Theorem: $m_*(Q) = |Q|$ for Q a closed cube (i.e. the outer measure equals the volume).

Proof (of Theorem).

Statement: if Q is a closed cube, then $m_*(Q) = |Q|$, the usual volume.

- $m_*(Q) \leq |Q|$:
 - Since $Q \subseteq Q$, $Q \Rightarrow Q$ and $m_*(Q) \leq |Q|$ since m_* is an infimum over such coverings.
- $|Q| \leq m_*(Q)$:
 - Fix $\varepsilon > 0$.
 - Let $\{Q_i\}_{i=1}^\infty \Rightarrow Q$ be arbitrary, it suffices to show that

$$|Q| \leq \left(\sum_{i=1}^\infty |Q_i| \right) + \varepsilon.$$

- Pick open cubes S_i such that $Q_i \subseteq S_i$ and $|Q_i| \leq |S_i| \leq (1 + \varepsilon)|Q_i|$.
- Then $\{S_i\} \Rightarrow Q$, so by compactness of Q pick a finite subcover with N elements.
- Note

$$Q \subseteq \bigcup_{i=1}^N S_i \implies |Q| \leq \sum_{i=1}^N |S_i| \leq \sum_{i=1}^N (1 + \varepsilon)|Q_i| \leq (1 + \varepsilon) \sum_{i=1}^\infty |Q_i|.$$

- Taking an infimum over coverings on the RHS preserves the inequality, so

$$|Q| \leq (1 + \varepsilon)m_*(Q)$$

- Take $\varepsilon \rightarrow 0$ to obtain final inequality. ■

1.2.1 a

- If $m_*(E) = \infty$, then take $B = \mathbb{R}^n$ since $m(\mathbb{R}^n) = \infty$.
- Suppose $N := m_*(E) < \infty$.
- Since $m_*(E)$ is an infimum, by definition, for every $\varepsilon > 0$ there exists a covering by closed cubes $\{Q_i(\varepsilon)\}_{i=1}^\infty \Rightarrow E$ depending on ε such that

$$\sum_{i=1}^\infty |Q_i(\varepsilon)| < N + \varepsilon.$$

- For each fixed n , set $\varepsilon_n = \frac{1}{n}$ to produce such a covering $\{Q_i(\varepsilon_n)\}_{i=1}^\infty$ and set $B_n := \bigcup_{i=1}^\infty Q_i(\varepsilon_n)$.
- The outer measure of cubes is *equal* to the sum of their volumes, so

$$m_*(B_n) = \sum_{i=1}^\infty |Q_i(\varepsilon_n)| < N + \varepsilon_n = N + \frac{1}{n}.$$

- Now set $B := \bigcap_{n=1}^{\infty} B_n$.
 - Since $E \subseteq B_n$ for every n , $E \subseteq B$
 - Since B is a countable intersection of countable unions of closed sets, B is Borel.
 - Since $B_n \subseteq B$ for every n , we can apply subadditivity to obtain the inequality

$$E \subseteq B \subseteq B_n \implies N \leq m_*(B) \leq m_*(B_n) < N + \frac{1}{n} \quad \text{for all } n \in \mathbb{Z}^{\geq 1}.$$

- This forces $m_*(E) = m_*(B)$.

1.2.2 b

Suppose $m_*(E) < \infty$.

- By (a), find a Borel set $B \supseteq E$ such that $m_*(B) = m_*(E)$
- Note that $E \subseteq B \implies B \cap E = E$ and $B \cap E^c = B \setminus E$.
- By assumption,

$$\begin{aligned} m_*(B) &= m_*(B \cap E) + m_*(B \cap E^c) \\ m_*(E) &= m_*(E) + m_*(B \setminus E) \\ m_*(E) - m_*(E) &= m_*(B \setminus E) \quad \text{since } m_*(E) < \infty \\ \implies m_*(B \setminus E) &= 0. \end{aligned}$$

- So take $N = B \setminus E$; this shows $m_*(N) = 0$ and $E = B \setminus (B \setminus E) = B \setminus N$.

If $m_*(E) = \infty$:

- Apply result to $E_R := E \cap [R, R+1)^n \subset \mathbb{R}^n$ for $R \in \mathbb{Z}$, so $E = \coprod_R E_R$
- Obtain B_R, N_R such that $E_R = B_R \setminus N_R$, $m_*(E_R) = m_*(B_R)$, and $m_*(N_R) = 0$.
- Note that
 - $B := \bigcup_R B_R$ is a union of Borel sets and thus still Borel
 - $E = \bigcup_R E_R$
 - $N := B \setminus E$
 - $N' := \bigcup_R N_R$ is a union of null sets and thus still null
- Since $E_R \subset B_R$ for every R , we have $E \subset B$
- We can compute

$$N = B \setminus E = \left(\bigcup_R B_R \right) \setminus \left(\bigcup_R E_R \right) \subseteq \bigcup_R (B_R \setminus E_R) = \bigcup_R N_R := N'$$

where $m_*(N') = 0$ since N' is null, and thus subadditivity forces $m_*(N) = 0$.

1.3 3

Concepts used:

- Limits

- Cauchy Criterion for Integrals: $\int_a^\infty f(x) dx$ converges iff for every $\varepsilon > 0$ there exists an M_0 such that $A, B \geq M_0$ implies $\left| \int_A^B f \right| < \varepsilon$, i.e. $\left| \int_A^B f \right| \xrightarrow{A \rightarrow \infty} 0$.
- Integrals of L^1 functions have vanishing tails: $\int_N^\infty |f| \xrightarrow{N \rightarrow \infty} 0$.
- Mean Value Theorem for Integrals: $\int_a^b f(t) dt = (b-a)f(c)$ for some $c \in [a, b]$.

1.3.1 a

Stated integral equality:

- Let $\varepsilon > 0$
- $C_c(\mathbb{R}^n) \hookrightarrow L^1(\mathbb{R}^n)$ is dense so choose $\{f_n\} \rightarrow f$ with $\|f_n - f\|_1 \rightarrow 0$.
- Since $\{f_n\}$ are compactly supported, choose $N_0 \gg 1$ such that f_n is zero outside of $B_{N_0}(\mathbf{0})$.
- Then

$$\begin{aligned}
 N \geq N_0 &\implies \int_{|x|>N} |f| = \int_{|x|>N} |f - f_n + f_n| \\
 &\leq \int_{|x|>N} |f - f_n| + \int_{|x|>N} |f_n| \\
 &= \int_{|x|>N} |f - f_n| \\
 &\leq \int_{|x|>N} \|f - f_n\|_1 \\
 &= \|f_n - f\|_1 \left(\int_{|x|>N} 1 \right) \\
 &\xrightarrow{n \rightarrow \infty} 0 \left(\int_{|x|>N} 1 \right) \\
 &= 0 \\
 &\xrightarrow{N \rightarrow \infty} 0.
 \end{aligned}$$

To see that this doesn't force $f(x) \rightarrow 0$ as $|x| \rightarrow \infty$:

- Take $f(x)$ to be a train of rectangles of height 1 and area $1/2^j$ centered on even integers.
- Then

$$\int_{|x|>N} |f| = \sum_{j=N}^{\infty} 1/2^j \xrightarrow{N \rightarrow \infty} 0$$

as the tail of a convergent sum.

- However $f(x) = 1$ for infinitely many even integers $x > N$, so $f(x) \not\rightarrow 0$ as $|x| \rightarrow \infty$.

1.3.2 b

Solution 1 ("Trick")

- Since f is decreasing on $[1, \infty)$, for any $t \in [x - n, x]$ we have

$$x - n \leq t \leq x \implies f(x) \leq f(t) \leq f(x - n).$$

- Integrate over $[x, 2x]$, using monotonicity of the integral:

$$\begin{aligned} \int_x^{2x} f(x) dt &\leq \int_x^{2x} f(t) dt \leq \int_x^{2x} f(x - n) dt \\ \implies f(x) \int_x^{2x} dt &\leq \int_x^{2x} f(t) dt \leq f(x - n) \int_x^{2x} dt \\ \implies xf(x) &\leq \int_x^{2x} f(t) dt \leq xf(x - n). \end{aligned}$$

- By the Cauchy Criterion for integrals, $\lim_{x \rightarrow \infty} \int_x^{2x} f(t) dt = 0$.
- So the LHS term $xf(x) \xrightarrow{x \rightarrow \infty} 0$.
- Since $x > 1$, $|f(x)| \leq |xf(x)|$
- Thus $f(x) \xrightarrow{x \rightarrow \infty} 0$ as well.

Solution 2 (Variation on the Trick)

- Use mean value theorem for integrals:

$$\int_x^{2x} f(t) dt = xf(c_x) \quad \text{for some } c_x \in [x, 2x] \text{ depending on } x.$$

- Since f is decreasing,

$$\begin{aligned} x \leq c_x \leq 2x &\implies f(2x) \leq f(c_x) \leq f(x) \\ \implies 2xf(2x) &\leq 2xf(c_x) \leq 2xf(x) \\ \implies 2xf(2x) &\leq 2x \int_x^{2x} f(t) dt \leq 2xf(x) \end{aligned}$$

- By Cauchy Criterion, $\int_x^{2x} f \rightarrow 0$.
- So $2xf(2x) \rightarrow 0$, which by a change of variables gives $uf(u) \rightarrow 0$.
- Since $u \geq 1$, $f(u) \leq uf(u)$ so $f(u) \rightarrow 0$ as well.

Solution 3 (Contradiction)

Just showing $f(x) \xrightarrow{x \rightarrow \infty} 0$:

- Toward a contradiction, suppose not.
- Since f is decreasing, it can not diverge to $+\infty$

- If $f(x) \rightarrow -\infty$, then $f \notin L^1(\mathbb{R})$: choose $x_0 \gg 1$ so that $t \geq x_0 \implies f(t) < -1$, then
- Then $t \geq x_0 \implies |f(t)| \geq 1$, so

$$\int_1^\infty |f| \geq \int_{x_0}^\infty |f(t)| dt \geq \int_{x_0}^\infty 1 = \infty.$$

- Otherwise $f(x) \rightarrow L \neq 0$, some finite limit.
- If $L > 0$:
 - Fix $\varepsilon > 0$, choose $x_0 \gg 1$ such that $t \geq x_0 \implies L - \varepsilon \leq f(t) \leq L$
 - Then

$$\int_1^\infty f \geq \int_{x_0}^\infty f \geq \int_{x_0}^\infty (L - \varepsilon) dt = \infty$$

- If $L < 0$:
 - Fix $\varepsilon > 0$, choose $x_0 \gg 1$ such that $t \geq x_0 \implies L \leq f(t) \leq L + \varepsilon$.
 - Then

$$\int_1^\infty f \geq \int_{x_0}^\infty f \geq \int_{x_0}^\infty (L) dt = \infty$$

Showing $xf(x) \xrightarrow{x \rightarrow \infty} 0$.

- Toward a contradiction, suppose not.
- (How to show that $xf(x) \not\rightarrow +\infty$?)
- If $xf(x) \rightarrow -\infty$
 - Choose a sequence $\Gamma = \{\hat{x}_i\}$ such that $x_i \rightarrow \infty$ and $x_i f(x_i) \rightarrow -\infty$.
 - Choose a subsequence $\Gamma' = \{x_i\}$ such that $x_i f(x_i) \leq -1$ for all i and $x_i \leq x_{i+1}$.
 - Choose a further subsequence $S = \{x_i \in \Gamma' \mid 2x_i < x_{i+1}\}$.
 - Then since f is always decreasing, for $t \geq x_0$, $|f|$ is increasing, and $|f(x_i)| \leq |f(2x_i)|$, so

$$\int_1^\infty |f| \geq \int_{x_0}^\infty |f| \geq \sum_{x_i \in S} \int_{x_i}^{2x_i} |f(t)| dt \geq \sum_{x_i \in S} \int_{x_i}^{2x_i} |f(x_i)| = \sum_{x_i \in S} x_i f(x_i) \rightarrow \infty.$$

- If $xf(x) \rightarrow L \neq 0$ for $0 < L < \infty$:
 - Fix $\varepsilon > 0$, choose an infinite sequence $\{x_i\}$ such that $L - \varepsilon \leq x_i f(x_i) \leq L$ for all i .

$$\int_1^\infty |f| \geq \sum_S \int_{x_i}^{2x_i} |f(t)| dt \geq \sum_S \int_{x_i}^{2x_i} f(x_i) dt = \sum_S x_i f(x_i) \geq \sum_S (L - \varepsilon) \rightarrow \infty.$$

- If $xf(x) \rightarrow L \neq 0$ for $-\infty < L < 0$:
 - Fix $\varepsilon > 0$, choose an infinite sequence $\{x_i\}$ such that $L \leq x_i f(x_i) \leq L + \varepsilon$ for all i .

$$\int_1^\infty |f| \geq \sum_S \int_{x_i}^{2x_i} |f(t)| dt \geq \sum_S \int_{x_i}^{2x_i} f(x_i) dt = \sum_S x_i f(x_i) \geq \sum_S (L) \rightarrow \infty.$$

Solution 4 (Akos's Suggestion) For $x \geq 1$,

$$|xf(x)| = \left| \int_x^{2x} f(x) dt \right| \leq \int_x^{2x} |f(x)| dt \leq \int_x^{2x} |f(t)| dt \leq \int_x^\infty |f(t)| dt \xrightarrow{x \rightarrow \infty} 0$$

where we've used

- Since f is decreasing and $\lim_{x \rightarrow \infty} f(x) = 0$ from part (a), f is non-negative.
- Since f is positive and decreasing, for every $t \in [x, 2x]$ we have $|f(x)| \leq |f(t)|$.
- By part (a), the last integral goes to zero.

Solution 5 (Peter's)

- Toward a contradiction, produce a sequence $x_i \rightarrow \infty$ with $x_i f(x_i) \rightarrow \infty$ and $x_i f(x_i) > \varepsilon > 0$, then

$$\begin{aligned} \int f(x) dx &\geq \sum_{i=1}^{\infty} \int_{x_i}^{x_{i+1}} f(x) dx \\ &\geq \sum_{i=1}^{\infty} \int_{x_i}^{x_{i+1}} f(x_{i+1}) dx \\ &= \sum_{i=1}^{\infty} f(x_{i+1}) \int_{x_i}^{x_{i+1}} dx \\ &\geq \sum_{i=1}^{\infty} (x_{i+1} - x_i) f(x_{i+1}) \\ &\geq \sum_{i=1}^{\infty} (x_{i+1} - x_i) \frac{\varepsilon}{x_{i+1}} \\ &= \varepsilon \sum_{i=1}^{\infty} \left(1 - \frac{x_{i-1}}{x_i}\right) \rightarrow \infty \end{aligned}$$

which can be ensured by passing to a subsequence where $\sum \frac{x_{i-1}}{x_i} < \infty$.

1.3.3 c

- No: take $f(x) = \frac{1}{x \ln x}$
- Then by a u -substitution,

$$\int_0^x f = \ln(\ln(x)) \xrightarrow{x \rightarrow \infty} \infty$$

is unbounded, so $f \notin L^1([1, \infty))$.

- But

$$xf(x) = \frac{1}{\ln(x)} \xrightarrow{x \rightarrow \infty} 0.$$

1.4 4

Relevant concepts:

- Tonelli: non-negative and measurable yields measurability of slices and equality of iterated integrals
- Fubini: $f(x, y) \in L^1$ yields *integrable* slices and equality of iterated integrals
- F/T: apply Tonelli to $|f|$; if finite, $f \in L^1$ and apply Fubini to f

$$\begin{aligned}
 \|H(x)\|_1 &= \int_{\mathbb{R}} |H(x, y)| \, dx \\
 &= \int_{\mathbb{R}} \left| \int_{\mathbb{R}} f(y)g(x-y) \, dy \right| \, dx \\
 &\leq \int_{\mathbb{R}} \left(\int_{\mathbb{R}} |f(y)g(x-y)| \, dy \right) \, dx \\
 &= \int_{\mathbb{R}} \left(\int_{\mathbb{R}} |f(y)g(x-y)| \, dx \right) \, dy \quad \text{by Tonelli} \\
 &= \int_{\mathbb{R}} \left(\int_{\mathbb{R}} |f(y)g(t)| \, dt \right) \, dy \quad \text{setting } t = x - y, \, dt = -dx \\
 &= \int_{\mathbb{R}} \left(\int_{\mathbb{R}} |f(y)| \cdot |g(t)| \, dt \right) \, dy \\
 &= \int_{\mathbb{R}} |f(y)| \cdot \left(\int_{\mathbb{R}} |g(t)| \, dt \right) \, dy \\
 &:= \int_{\mathbb{R}} |f(y)| \cdot \|g\|_1 \, dy \\
 &= \|g\|_1 \int_{\mathbb{R}} |f(y)| \, dy \\
 &:= \|g\|_1 \|f\|_1 \\
 &< \infty \quad \text{by assumption} \quad .
 \end{aligned}$$

- H is measurable on \mathbb{R}^2 :
 - If we can show $\tilde{f}(x, y) := f(y)$ and $\tilde{g}(x, y) := g(x - y)$ are both measurable on \mathbb{R}^2 , then $H = \tilde{f} \cdot \tilde{g}$ is a product of measurable functions and thus measurable.
 - $f \in L^1$, and L^1 functions are measurable by definition.
 - The function $(x, y) \mapsto g(x - y)$ is measurable on \mathbb{R}^2 :
 - * Let g be measurable on \mathbb{R} , then the cylinder function $G(x, y) = g(x)$ on \mathbb{R}^2 is always measurable
 - * Define a linear transformation $T := [1, -1; 0, 1]$ which sends $(x, y) \rightarrow (x - y, y)$, then $T \in \text{GL}(2, \mathbb{R})$ is linear and thus measurable.
 - * Then $(G \circ T)(x, y) = G(x - y, y) = \tilde{g}(x - y)$, so \tilde{g} is a composition of measurable functions and thus measurable.
- Apply **Tonelli** to $|H|$
 - H measurable implies $|H|$ is measurable
 - $|H|$ is non-negative
 - So the iterated integrals are equal in the extended sense
 - The calculation shows the iterated integral is finite, to $\int |H|$ is finite and H is thus integrable on \mathbb{R}^2 .

Note: Fubini is not needed, since we're not calculating the actual integral, just showing H is integrable.

1.5 5

Concepts used:

- DCT
- Passing limits through products and quotients

Note that

$$\begin{aligned}\lim_n \left(1 + \frac{x^2}{n}\right)^{-(n+1)} &= \frac{1}{\lim_n \left(1 + \frac{x^2}{n}\right)^1 \left(1 + \frac{x^2}{n}\right)^n} \\ &= \frac{1}{1 \cdot e^{x^2}} \\ &= e^{-x^2}.\end{aligned}$$

If passing the limit through the integral is justified, we will have

$$\begin{aligned}\lim_{n \rightarrow \infty} \int_0^n \left(1 + \frac{x^2}{n}\right)^{-(n+1)} dx &= \lim_{n \rightarrow \infty} \int_{\mathbb{R}} \chi_{[0,n]} \left(1 + \frac{x^2}{n}\right)^{-(n+1)} dx \\ &= \int_{\mathbb{R}} \lim_{n \rightarrow \infty} \chi_{[0,n]} \left(1 + \frac{x^2}{n}\right)^{-(n+1)} dx \quad \text{by the DCT} \\ &= \int_{\mathbb{R}} \lim_{n \rightarrow \infty} \left(1 + \frac{x^2}{n}\right)^{-(n+1)} dx \\ &= \int_0^\infty e^{-x^2} dx \\ &= \frac{\sqrt{\pi}}{2}.\end{aligned}$$

Computing the last integral:

$$\begin{aligned}\left(\int_{\mathbb{R}} e^{-x^2} dx\right)^2 &= \left(\int_{\mathbb{R}} e^{-x^2} dx\right) \left(\int_{\mathbb{R}} e^{-y^2} dy\right) \\ &= \int_{\mathbb{R}} \int_{\mathbb{R}} e^{-(x+y)^2} dx dy \\ &= \int_0^{2\pi} \int_0^\infty e^{-r^2} r dr d\theta \quad u = r^2 \\ &= \frac{1}{2} \int_0^{2\pi} \int_0^\infty e^{-u} du d\theta \\ &= \frac{1}{2} \int_0^{2\pi} 1 d\theta \\ &= \pi,\end{aligned}$$

and now use the fact that the function is even so $\int_0^\infty f = \frac{1}{2} \int_{\mathbb{R}} f$.

Justifying the DCT:

- Apply Bernoulli's inequality:

$$1 + \frac{x^{2n+1}}{n} \geq 1 + \frac{x^2}{n} (1 + x^2) \geq 1 + x^2,$$

where the last inequality follows from the fact that $1 + \frac{x^2}{n} \geq 1$

Flesh out

1.6 6

Concepts used:

- For $e_n(x) := e^{2\pi i n x}$, the set $\{e_n\}$ is an orthonormal basis for $L^2([0, 1])$.
- For any orthonormal sequence in a Hilbert space, we have Bessel's inequality:

$$\sum_{k=1}^{\infty} |\langle x, e_k \rangle|^2 \leq \|x\|^2.$$

- When $\{e_n\}$ is a basis, the above is an *equality* (Parseval)
- Arguing uniform convergence: since $\{\hat{f}(n)\} \in \ell^1(\mathbb{Z})$, we should be able to apply the M test.

1.6.1 a

Claim: $\ell^1(\mathbb{Z}) \subseteq \ell^2(\mathbb{Z})$.

- Set $\mathbf{c} = \{c_k \mid k \in \mathbb{Z}\} \in \ell^1(\mathbb{Z})$.
- It suffices to show that if $\sum_{k \in \mathbb{Z}} |c_k| < \infty$ then $\sum_{k \in \mathbb{Z}} |c_k|^2 < \infty$.
- Let $S = \{c_k \mid |c_k| \leq 1\}$, then $c_k \in S \implies |c_k|^2 \leq |c_k|$
- Claim: S^c can only contain finitely many elements, all of which are finite.
 - If not, either $S^c := \{c_j\}_{j=1}^\infty$ is infinite with every $|c_j| > 1$, which forces

$$\sum_{c_k \in S^c} |c_k| = \sum_{j=1}^{\infty} |c_j| > \sum_{j=1}^{\infty} 1 = \infty.$$

– If any $c_j = \infty$, then $\sum_{k \in \mathbb{Z}} |c_k| \geq c_j = \infty$.

- So S^c is a finite set of finite integers, let $N = \max \{|c_j|^2 \mid c_j \in S^c\} < \infty$.

- Rewrite the sum

$$\begin{aligned}
\sum_{k \in \mathbb{Z}} |c_k|^2 &= \sum_{c_k \in S} |c_k|^2 + \sum_{c_k \in S^c} |c_k|^2 \\
&\leq \sum_{c_k \in S} |c_k| + \sum_{c_k \in S^c} |c_k|^2 \\
&\leq \sum_{k \in \mathbb{Z}} |c_k| + \sum_{c_k \in S^c} |c_k|^2 \quad \text{since the } |c_k| \text{ are all positive} \\
&= \|\mathbf{c}\|_{\ell^1} + \sum_{c_k \in S^c} |c_k|^2 \\
&\leq \|\mathbf{c}\|_{\ell^1} + |S^c| \cdot N \\
&< \infty.
\end{aligned}$$

Claim: $L^2([0, 1]) \subseteq L^1([0, 1])$.

- It suffices to show that $\int |f|^2 < \infty \implies \int |f| < \infty$.
- Define $S = \{x \in [0, 1] \mid |f(x)| \leq 1\}$, then $x \in S^c \implies |f(x)|^2 \geq |f(x)|$.
- Break up the integral:

$$\begin{aligned}
\int_{\mathbb{R}} |f| &= \int_S |f| + \int_{S^c} |f| \\
&\leq \int_S |f| + \int_{S^c} |f|^2 \\
&\leq \int_S |f| + \|f\|_2 \\
&\leq \sup_{x \in S} \{|f(x)|\} \cdot \mu(S) + \|f\|_2 \\
&= 1 \cdot \mu(S) + \|f\|_2 \quad \text{by definition of } S \\
&\leq 1 \cdot \mu([0, 1]) + \|f\|_2 \quad \text{since } S \subseteq [0, 1] \\
&= 1 + \|f\|_2 \\
&< \infty.
\end{aligned}$$

Note: this proof shows $L^2(X) \subseteq L^1(X)$ whenever $\mu(X) < \infty$.

2 Fall 2019

2.1 1

Cesaro mean/summation. Break series apart into pieces that can be handled separately.

2.2 a

Prove a stronger result:

$$a_k \longrightarrow S \implies S_N := \frac{1}{N} \sum_{k=1}^N a_k \longrightarrow S.$$

Idea: once N is large enough, $a_k \approx S$, and all smaller terms will die off as $N \rightarrow \infty$.
See this MSE answer.

- Use convergence $a_k \rightarrow S$: choose M large enough such that

$$k \geq M + 1 \implies |a_k - S| < \varepsilon.$$

Then

$$\begin{aligned} \left| \left(\frac{1}{N} \sum_{k=1}^N a_k \right) - S \right| &= \frac{1}{N} \left| \left(\sum_{k=1}^N a_k \right) - NS \right| \\ &= \frac{1}{N} \left| \left(\sum_{k=1}^N a_k \right) - \sum_{k=1}^N S \right| \\ &= \frac{1}{N} \left| \sum_{k=1}^N (a_k - S) \right| \\ &\leq \frac{1}{N} \sum_{k=1}^N |a_k - S| \\ &= \frac{1}{N} \sum_{k=1}^M |a_k - S| + \sum_{k=M+1}^N |a_k - S| \\ &\leq \frac{1}{N} \sum_{k=1}^M |a_k - S| + \sum_{k=M+1}^N \frac{\varepsilon}{2} \\ &= \frac{1}{N} \sum_{k=1}^M |a_k - S| + (N - M) \frac{\varepsilon}{2} \\ &\xrightarrow{\varepsilon \rightarrow 0} \frac{1}{N} \sum_{k=1}^M |a_k - S| + 0 \\ &\xrightarrow{N \rightarrow \infty} 0 + 0. \end{aligned}$$

Note: M is fixed, so the last sum is some constant c , and $c/N \rightarrow 0$ as $N \rightarrow \infty$ for any constant. To be more careful, choose M first to get $\varepsilon/2$ for the tail, then choose $N(M) > M$ for the remaining truncated part of the sum.

2.3 b

- Define

$$\Gamma_n := \sum_{k=n}^{\infty} \frac{a_k}{k}.$$

- $\Gamma_1 = \sum_{k=1}^{\infty} \frac{a_k}{k}$ is the original series and each Γ_n is a tail of Γ_1 , so by assumption $\Gamma_n \xrightarrow{n \rightarrow \infty} 0$.

- Compute

$$\frac{1}{n} \sum_{k=1}^n a_k = \frac{1}{n} (\Gamma_1 + \Gamma_2 + \cdots + \Gamma_n - \Gamma_{n+1})$$

- This comes from consider the following summation:

$\Gamma_1 :$	a_1	$+$	$\frac{a_2}{2}$	$+$	$\frac{a_3}{3}$	$+$	\cdots
$\Gamma_2 :$			$\frac{a_2}{2}$	$+$	$\frac{a_3}{3}$	$+$	\cdots
$\Gamma_3 :$				$+$	$\frac{a_3}{3}$	$+$	\cdots
$\sum_{i=1}^n \Gamma_i :$	a_1	$+$	a_2	$+$	a_3	$+$	\cdots
	a_n	$+$	$\frac{a_{n+1}}{n+1}$	$+$	\cdots		

- Use part (a): since $\Gamma_n \xrightarrow{n \rightarrow \infty} 0$, we have $\frac{1}{n} \sum_{k=1}^n \Gamma_k \xrightarrow{n \rightarrow \infty} 0$.
- Also a minor check: $\Gamma_n \rightarrow 0 \implies \frac{1}{n} \Gamma_n \rightarrow 0$.
- Then

$$\begin{aligned} \frac{1}{n} \sum_{k=1}^n a_k &= \frac{1}{n} (\Gamma_1 + \Gamma_2 + \cdots + \Gamma_n - \Gamma_{n+1}) \\ &= \left(\frac{1}{n} \sum_{k=0}^n \Gamma_k \right) - \left(\frac{1}{n} \Gamma_{n+1} \right) \\ &\xrightarrow{n \rightarrow \infty} 0. \end{aligned}$$

■

2.4 2

DCT, and bounding in the right place. Don't evaluate the actual integral!

- By induction on the number of limits we can pass through the integral.

- For $n = 1$ we first pass one derivative into the integral: let $x_n \rightarrow x$ be any sequence converging to x , then

$$\begin{aligned}
\frac{\partial}{\partial x} \frac{\sin(x)}{x} &= \frac{\partial}{\partial x} \int_0^1 \cos(tx) dt \\
&= \lim_{x_n \rightarrow x} \frac{1}{x_n - x} \left(\int_0^1 \cos(tx_n) dt - \int_0^1 \cos(tx) dt \right) \\
&= \lim_{x_n \rightarrow x} \left(\int_0^1 \frac{\cos(tx_n) - \cos(tx)}{x_n - x} dt \right) \\
&= \lim_{x_n \rightarrow x} \left(\int_0^1 \left(t \sin(tx) \Big|_{x=\xi_n} \right) dt \right) \quad \text{where } \xi_n \in [x_n, x] \text{ by MVT, } \xi_n \rightarrow x \\
&= \lim_{\xi_n \rightarrow x} \left(\int_0^1 t \sin(t\xi_n) dt \right) \\
&\stackrel{\text{DCT}}{=} \int_0^1 \lim_{\xi_n \rightarrow x} t \sin(t\xi_n) dt \\
&= \int_0^1 t \sin(tx) dt
\end{aligned}$$

- Taking absolute values we obtain an upper bound

$$\begin{aligned}
\left| \frac{\partial}{\partial x} \frac{\sin(x)}{x} \right| &= \left| \int_0^1 t \sin(tx) dt \right| \\
&\leq \int_0^1 |t \sin(tx)| dt \\
&\leq \int_0^1 1 dt = 1,
\end{aligned}$$

since $t \in [0, 1] \implies |t| < 1$, and $|\sin(xt)| \leq 1$ for any x and t .

- Note that this bound also justifies the DCT, since the functions $f_n(t) = t \sin(t\xi_n)$ are uniformly dominated by $g(t) = 1$ on $L^1([0, 1])$.

Note: integrating by parts here yields the actual formula:

$$\begin{aligned}
\int_0^1 t \sin(tx) dt &\stackrel{\text{IBP}}{=} \left(\frac{-t \cos(tx)}{x} \right) \Big|_{t=0}^{t=1} - \int_0^1 \frac{\cos(tx)}{x} dt \\
&= \frac{-\cos(x)}{x} - \frac{\sin(x)}{x^2} \\
&= \frac{x \cos(x) - \sin(x)}{x^2}.
\end{aligned}$$

- For the inductive step, we assume that we can pass $n - 1$ limits through the integral and show

we can pass the n th through as well.

$$\begin{aligned}\frac{\partial^n}{\partial x^n} \frac{\sin(x)}{x} &= \frac{\partial^n}{\partial x^n} \int_0^1 \cos(tx) dt \\ &= \frac{\partial}{\partial x} \int_0^1 \frac{\partial^{n-1}}{\partial x^{n-1}} \cos(tx) dt \\ &= \frac{\partial}{\partial x} \int_0^1 t^{n-1} f_{n-1}(x, t) dt\end{aligned}$$

- Note that $f_n(x, t) = \pm \sin(tx)$ when n is odd and $f_n(x, t) = \pm \cos(tx)$ when n is even, and a constant factor of t is multiplied when each derivative is taken.

- We continue as in the base case:

$$\begin{aligned}\frac{\partial}{\partial x} \int_0^1 t^{n-1} f_{n-1}(x, t) dt &= \lim_{x_k \rightarrow x} \int_0^1 t^{n-1} \left(\frac{f_{n-1}(x_k, t) - f_{n-1}(x, t)}{x_k - x} \right) dt \\ &=_{\text{IVT}} \lim_{x_k \rightarrow x} \int_0^1 t^{n-1} \frac{\partial f_{n-1}}{\partial x}(\xi_k, t) dt \quad \text{where } \xi_k \in [x_k, x], \xi_k \rightarrow x \\ &=_{\text{DCT}} \int_0^1 \lim_{x_k \rightarrow x} t^{n-1} \frac{\partial f_{n-1}}{\partial x}(\xi_k, t) dt \\ &:= \int_0^1 \lim_{x_k \rightarrow x} t^n f_n(\xi_k, t) dt \\ &:= \int_0^1 t^n f_n(x, t) dt.\end{aligned}$$

- We've used the fact that $f_0(x) = \cos(tx)$ is smooth as a function of x , and in particular continuous
- The DCT is justified because the functions $h_{n,k}(x, t) = t^n f_n(\xi_k, t)$ are again uniformly (in k) bounded by 1 since $t \leq 1 \implies t^n \leq 1$ and each f_n is a sin or cosine.
- Now take absolute values

$$\begin{aligned}\left| \frac{\partial^n}{\partial x^n} \frac{\sin(x)}{x} \right| &= \left| \int_0^1 -t^n f_n(x, t) dt \right| \\ &\leq \int_0^1 |t^n f_n(x, t)| dt \\ &\leq \int_0^1 |t^n| |f_n(x, t)| dt \\ &\leq \int_0^1 |t^n| \cdot 1 dt \\ &\leq \int_0^1 t^n dt \quad \text{since } t \text{ is positive} \\ &= \frac{1}{n+1} \\ &< \frac{1}{n}.\end{aligned}$$

- We've again used the fact that $f_n(x, t)$ is of the form $\pm \cos(tx)$ or $\pm \sin(tx)$, both of which are bounded by 1.

■

2.5 3

Concepts used:

- Borel-Cantelli: for a sequence of sets X_n ,

$$\begin{aligned}\limsup_n X_n &= \left\{ x \mid x \in X_n \text{ for infinitely many } n \right\} &= \bigcap_{m \in \mathbb{N}} \bigcup_{n \geq m} X_n \\ \liminf_n X_n &= \left\{ x \mid x \in X_n \text{ for all but finitely many } n \right\} &= \bigcup_{m \in \mathbb{N}} \bigcap_{n \geq m} X_n.\end{aligned}$$

- Properties of logs and exponentials:

$$\prod_n e^{x_n} = e^{\sum_n x_n} \quad \text{and} \quad \sum_n \log(x_n) = \log\left(\prod_n x_n\right).$$

- Tails of convergent sums vanish.
- Continuity of measure: $B_n \searrow B$ and $\mu(B_0) < \infty$ implies $\lim_n \mu(B_n) = \mu(B)$, and $B_n \nearrow B \implies \lim_n \mu(B_n) = \mu(B)$.

2.5.1 a

- The Borel σ -algebra is closed under countable unions/intersections/complements,
- $B = \limsup_n B_n$ is an intersection of unions of measurable sets.

2.5.2 b

- Tails of convergent sums go to zero, so $\sum_{n \geq M} \mu(B_n) \xrightarrow{M \rightarrow \infty} 0$,
- $B_M := \bigcap_{m=1}^M \bigcup_{n \geq m} B_n \searrow B$.

$$\begin{aligned}\mu(B_M) &= \mu\left(\bigcap_{m \in \mathbb{N}} \bigcup_{n \geq m} B_n\right) \\ &\leq \mu\left(\bigcup_{n \geq m} B_n\right) \quad \text{for all } m \in \mathbb{N} \text{ by countable subadditivity} \\ &\longrightarrow 0,\end{aligned}$$

- The result follows by continuity of measure.

2.5.3 c

- To show $\mu(B) = 1$, we'll show $\mu(B^c) = 0$.

- Let $B_k = \bigcap_{m=1}^{\infty} \bigcup_{n=m}^K B_n$. Then

$$\begin{aligned}
 \mu(B_K^c) &= \mu\left(\bigcup_{m=1}^{\infty} \bigcap_{n=m}^K B_n^c\right) \\
 &\leq \sum_{m=1}^{\infty} \mu\left(\bigcap_{n=m}^K B_n^c\right) \quad \text{by subadditivity} \\
 &= \sum_{m=1}^{\infty} \prod_{n=m}^K (1 - \mu(B_n)) \quad \text{by assumption} \\
 &\leq \sum_{m=1}^{\infty} \prod_{n=m}^K e^{-\mu(B_n^c)} \quad \text{by hint} \\
 &= \sum_{m=1}^{\infty} \exp\left(-\sum_{n=m}^K \mu(B_n^c)\right) \\
 &\stackrel{K \rightarrow \infty}{\longrightarrow} 0
 \end{aligned}$$

since $\sum_{n=m}^K \mu(B_n^c) \stackrel{K \rightarrow \infty}{\longrightarrow} \infty$ by assumption

- We can apply continuity of measure since $B_K^c \xrightarrow{K \rightarrow \infty} B^c$.

Proving the hint: ?

■

2.6 4

Concepts used:

- Bessel's Inequality
- Pythagoras
- Surjectivity of the Riesz map
- Parseval's Identity
- Trick – remember to write out finite sum S_N , and consider $\|x - S_N\|$.

2.6.1 a

Claim:

$$\begin{aligned}
 0 \leq \left\| x - \sum_{n=1}^N \langle x, u_n \rangle u_n \right\|^2 &= \|x\|^2 - \sum_{n=1}^N |\langle x, u_n \rangle|^2 \\
 &\implies \sum_{n=1}^{\infty} |\langle x, u_n \rangle|^2 \leq \|x\|^2.
 \end{aligned}$$

Proof: Let $S_N = \sum_{n=1}^N \langle x, u_n \rangle u_n$. Then

$$\begin{aligned} 0 &\leq \|x - S_N\|^2 \\ &= \langle x - S_N, x - S_N \rangle \\ &= \|x\|^2 - \sum_{n=1}^N |\langle x, u_n \rangle|^2 \\ &\xrightarrow{N \rightarrow \infty} \|x\|^2 - \sum_{n=1}^{\infty} |\langle x, u_n \rangle|^2. \end{aligned}$$

2.6.2 b

1. Fix $\{a_n\} \in \ell^2$, then note that $\sum |a_n|^2 < \infty \implies$ the tails vanish.
2. Define

$$x := \lim_{N \rightarrow \infty} S_N = \lim_{N \rightarrow \infty} \sum_{k=1}^N a_k u_k$$

3. $\{S_N\}$ Cauchy (by 1) and H complete $\implies x \in H$.
- 4.

$$\langle x, u_n \rangle = \left\langle \sum_k a_k u_k, u_n \right\rangle = \sum_k a_k \langle u_k, u_n \rangle = a_n \quad \forall n \in \mathbb{N}$$

since the u_k are all orthogonal.

- 5.

$$\|x\|^2 = \left\| \sum_k a_k u_k \right\|^2 = \sum_k \|a_k u_k\|^2 = \sum_k |a_k|^2$$

by Pythagoras since the u_k are normal.

Bonus: We didn't use completeness here, so the Fourier series may not actually converge to x . If $\{u_n\}$ is **complete** (so $x = 0 \iff \langle x, u_n \rangle = 0 \forall n$) then the Fourier series *does* converge to x and $\sum_{n=1}^{\infty} |\langle x, u_n \rangle|^2 = \|x\|^2$ for all $x \in H$.

■

2.7 5

Continuity in L^1 (recall that DCT won't work! Notes 19.4, prove it for a dense subset first).
Lebesgue differentiation in 1-dimensional case. See HW 5.6.

2.8 a

Choose $g \in C_c^0$ such that $\|f - g\|_1 \rightarrow 0$.

By translation invariance, $\|\tau_h f - \tau_h g\|_1 \rightarrow 0$.

Write

$$\begin{aligned} \|\tau f - f\|_1 &= \|\tau_h f - g + g - \tau_h g + \tau_h g - f\|_1 \\ &\leq \|\tau_h f - \tau_h g\| + \|g - f\| + \|\tau_h g - g\| \\ &\rightarrow \|\tau_h g - g\|, \end{aligned}$$

so it suffices to show that $\|\tau_h g - g\| \rightarrow 0$ for $g \in C_c^0$.

Fix $\varepsilon > 0$. Enlarge the support of g to K such that

$$|h| \leq 1 \text{ and } x \in K^c \implies |g(x - h) - g(x)| = 0.$$

By uniform continuity of g , pick $\delta \leq 1$ small enough such that

$$x \in K, |h| \leq \delta \implies |g(x - h) - g(x)| < \varepsilon,$$

then

$$\int_K |g(x - h) - g(x)| \leq \int_K \varepsilon = \varepsilon \cdot m(K) \rightarrow 0.$$

2.9 b

We have

$$\begin{aligned} \int_{\mathbb{R}} |A_h(f)(x)| \, dx &= \int_{\mathbb{R}} \left| \frac{1}{2h} \int_{x-h}^{x+h} f(y) \, dy \right| \, dx \\ &\leq \frac{1}{2h} \int_{\mathbb{R}} \int_{x-h}^{x+h} |f(y)| \, dy \, dx \\ &=_{FT} \frac{1}{2h} \int_{\mathbb{R}} \int_{y-h}^{y+h} |f(y)| \, dx \, dy \\ &= \int_{\mathbb{R}} |f(y)| \, dy \\ &= \|f\|_1. \end{aligned}$$

and (rough sketch)

$$\begin{aligned}
\int_{\mathbb{R}} |A_h(f)(x) - f(x)| \, dx &= \int_{\mathbb{R}} \left| \left(\frac{1}{2h} \int_{B(h,x)} f(y) \, dy \right) - f(x) \right| \, dx \\
&= \int_{\mathbb{R}} \left| \left(\frac{1}{2h} \int_{B(h,x)} f(y) \, dy \right) - \frac{1}{2h} \int_{B(h,x)} f(x) \, dy \right| \, dx \\
&\leq_{FT} \frac{1}{2h} \int_{\mathbb{R}} \int_{B(h,x)} |f(y-x) - f(x)| \, \mathbf{d}\mathbf{x} \, dy \\
&\leq \frac{1}{2h} \int_{\mathbb{R}} \|\tau_x f - f\|_1 \, dy \\
&\longrightarrow 0 \quad \text{by (a).}
\end{aligned}$$

■

3 Spring 2019

3.1 1

3.1.1 a

- Let $\{f_n\}$ be a Cauchy sequence in $C(I, \|\cdot\|_{\infty})$, so $\lim_n \lim_m \|f_m - f_n\|_{\infty} = 0$, we will show it converges to some f in this space.
- For each fixed $x_0 \in [0, 1]$, the sequence of real numbers $\{f_n(x_0)\}$ is Cauchy in \mathbb{R} since

$$x_0 \in I \implies |f_m(x_0) - f_n(x_0)| \leq \sup_{x \in I} |f_m(x) - f_n(x)| := \|f_m - f_n\|_{\infty} \xrightarrow{m > n \rightarrow \infty} 0,$$

- Since \mathbb{R} is complete, this sequence converges and we can define $f(x) := \lim_{k \rightarrow \infty} f_k(x)$.
- Thus $f_n \rightarrow f$ pointwise by construction
- Claim: $\|f - f_n\| \xrightarrow{n \rightarrow \infty} 0$, so f_n converges to f in $C([0, 1], \|\cdot\|_{\infty})$.

– Proof:

- * Fix $\varepsilon > 0$; we will show there exists an N such that $n \geq N \implies \|f_n - f\| < \varepsilon$
- * Fix an $x_0 \in I$. Since $f_n \rightarrow f$ pointwise, choose N_1 large enough so that

$$n \geq N_1 \implies |f_n(x_0) - f(x_0)| < \varepsilon/2.$$

- * Since $\|f_n - f_m\|_{\infty} \rightarrow 0$, choose and N_2 large enough so that

$$n, m \geq N_2 \implies \|f_n - f_m\|_{\infty} < \varepsilon/2.$$

* Then for $n, m \geq \max(N_1, N_2)$, we have

$$\begin{aligned}
 |f_n(x_0) - f(x_0)| &= |f_n(x_0) - f(x_0) + f_m(x_0) - f_m(x_0)| \\
 &= |f_n(x_0) - f_m(x_0) + f_m(x_0) - f(x_0)| \\
 &\leq |f_n(x_0) - f_m(x_0)| + |f_m(x_0) - f(x_0)| \\
 &< |f_n(x_0) - f_m(x_0)| + \frac{\varepsilon}{2} \\
 &\leq \sup_{x \in I} |f_n(x) - f_m(x)| + \frac{\varepsilon}{2} \\
 &< \|f_n - f_m\|_\infty + \frac{\varepsilon}{2} \\
 &\leq \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \\
 \implies |f_n(x_0) - f(x_0)| &< \varepsilon \\
 \implies \sup_{x \in I} |f_n(x_0) - f(x_0)| &\leq \sup_{x \in I} \varepsilon \quad \text{by order limit laws} \\
 \implies \|f_n - f\| &\leq \varepsilon
 \end{aligned}$$

- f is the uniform limit of continuous functions and thus continuous, so $f \in C([0, 1])$.

3.1.2 b

- It suffices to produce a Cauchy sequence that does not converge to a continuous function.
- Take the following sequence of functions:
 - f_1 increases linearly from 0 to 1 on $[0, 1/2]$ and is 1 on $[1/2, 1]$
 - f_2 is 0 on $[0, 1/4]$ increases linearly from 0 to 1 on $[1/4, 1/2]$ and is 1 on $[1/2, 1]$
 - f_3 is 0 on $[0, 3/8]$ increases linearly from 0 to 1 on $[3/8, 1/2]$ and is 1 on $[1/2, 1]$
 - f_3 is 0 on $[0, (1/2 - 3/8)/2]$ increases linearly from 0 to 1 on $[(1/2 - 3/8)/2, 1/2]$ and is 1 on $[1/2, 1]$

Idea: take sequence starting points for the triangles: $0, 0 + \frac{1}{4}, 0 + \frac{1}{4} + \frac{1}{8}, \dots$ which converges to $1/2$ since $\sum_{k=1}^{\infty} \frac{1}{2^k} = -\frac{1}{2} + \sum_{k=0}^{\infty} \frac{1}{2^k}$.

- Then each f_n is clearly integrable, since its graph is contained in the unit square.
- $\{f_n\}$ is Cauchy: geometrically subtracting areas yields a single triangle whose area tends to 0.
- But f_n converges to $\chi_{[\frac{1}{2},1]}$ which is discontinuous.

Todo: show that $\int_0^1 |f_n(x) - f_m(x)| dx \rightarrow 0$ rigorously, show that no $g \in L^1([0,1])$ can converge to this indicator function.

3.2 2

3.2.1 a

See Folland p.26

- Lemma 1: $\mu(\coprod_{k=1}^{\infty} E_k) = \lim_{N \rightarrow \infty} \sum_{k=1}^N \mu(E_k)$.
- Suppose $F_0 \supseteq F_1 \supseteq \dots$.
- Let $A_k = F_k \setminus F_{k+1}$, since the F_k are nested the A_k are disjoint
- Set $A := \coprod_{k=1}^{\infty} A_k$ and $F := \bigcap_{k=1}^{\infty} F_k$.
- Note $X = X \setminus Y \coprod X \cap Y$ for any two sets (just write $X \setminus Y := X \cap Y^c$)
- Note that A contains anything that was removed from F_0 when passing from any F_j to F_{j+1} , while F contains everything that is never removed at any stage, and these are disjoint possibilities.

- Thus $F_0 = F \coprod A$, so

$$\begin{aligned}
\mu(F_0) &= \mu(F) + \mu(A) \\
&= \mu(F) + \mu\left(\coprod_{k=1}^{\infty} A_k\right) \\
&= \mu(F) + \lim_{n \rightarrow \infty} \sum_{k=0}^n \mu(A_k) \quad \text{by countable additivity} \\
&= \mu(F) + \lim_{n \rightarrow \infty} \sum_{k=0}^n \mu(F_k) - \mu(F_{k+1}) \\
&= \mu(F) + \lim_{n \rightarrow \infty} (\mu(F_1) - \mu(F_n)) \quad (\text{Telescoping}) \\
&= \mu(F) + \mu(F_1) - \lim_{n \rightarrow \infty} \mu(F_n),
\end{aligned}$$

- Since μ is a finite measure, $\mu(F_1) < \infty$ and can be subtracted, yielding

$$\begin{aligned}
\mu(F_1) &= \mu(F) + \mu(F_1) - \lim_{n \rightarrow \infty} \mu(F_n) \\
\implies \mu(F) &= \lim_{n \rightarrow \infty} \mu(F_n) \\
\implies \mu\left(\bigcap_{k=1}^{\infty} F_k\right) &= \lim_{n \rightarrow \infty} \mu(F_n).
\end{aligned}$$

3.2.2 b

- Toward a contradiction, negate the implication: suppose there exists an $\varepsilon > 0$ such that for all δ , we have $m(E) < \delta$ but $\mu(E) > \varepsilon$.
- The sequence $\left\{\delta_n := \frac{1}{2^n}\right\}_{n \in \mathbb{N}}$ and produce sets $A_n \in \mathcal{B}$ such $m(A_n) < \frac{1}{2^n}$ but $\mu(A_n) > \varepsilon$.
- Define

$$\begin{aligned}
F_n &:= \bigcup_{j \geq n} A_j \\
C_m &:= \bigcap_{k=1}^m F_k \\
A &:= C_{\infty} := \bigcap_{k=1}^{\infty} F_k.
\end{aligned}$$

- Note that $F_1 \supseteq F_2 \supseteq \dots$, since each increase in index unions fewer sets.
- By continuity for the Lebesgue measure,

$$m(A) = m\left(\bigcap_{k=1}^{\infty} F_k\right) = \lim_{k \rightarrow \infty} m(F_k) = \lim_{k \rightarrow \infty} m\left(\bigcup_{j \geq k} A_j\right) \leq \lim_{k \rightarrow \infty} \sum_{j \geq k} m(A_j) = \lim_{k \rightarrow \infty} \sum_{j \geq k} \frac{1}{2^j} = 0,$$

which follows because this is the tail of a convergent sum

- Thus $m(A) = 0$ and by assumption, this implies $\mu(A) = 0$.

- However, by part (a),

$$\mu(A) = \lim_n \mu \left(\bigcup_{k=n}^{\infty} A_k \right) \geq \lim_n \mu(A_n) = \lim_n \varepsilon = \varepsilon > 0.$$

All messed up.

3.3 3

Concepts used:

- Definition of L^+ : space of measurable function $X \rightarrow [0, \infty]$.
- Fatou: For any sequence of L^+ functions, $\int \liminf f_n \leq \liminf \int f_n$.
- Egorov's Theorem: If $E \subseteq \mathbb{R}^n$ is measurable, $m(E) > 0$, $f_k : E \rightarrow \mathbb{R}$ a sequence of measurable functions where $\lim_{n \rightarrow \infty} f_n(x)$ exists and is finite a.e., then $f_n \rightarrow f$ *almost uniformly*: for every $\varepsilon > 0$ there exists a closed subset $F_\varepsilon \subseteq E$ with $m(E \setminus F_\varepsilon) < \varepsilon$ and $f_n \rightarrow f$ uniformly on F_ε .

L^2 bound:

- Since $f_k \rightarrow f$ almost everywhere, $\liminf_n f_n(x) = f(x)$ a.e.
- $\|f_n\|_2 < \infty$ implies each f_n is measurable and thus $|f_n|^2 \in L^+$, so we can apply Fatou:

$$\begin{aligned} \|f\|_2^2 &= \int |f(x)|^2 \\ &= \int \liminf_n |f_n(x)|^2 \\ &\leq \liminf_n \int |f_n(x)|^2 \\ &\leq \liminf_n M \\ &= M. \end{aligned}$$

- Thus $\|f\|_2 \leq \sqrt{M} < \infty$ implying $f \in L^2$.

Equality of Integrals:

What is the "right" proof here that uses the first part?

- Take the sequence $\varepsilon_n = \frac{1}{n}$
- Apply Egorov's theorem: obtain a set F_ε such that $f_n \rightarrow f$ uniformly on F_ε and $m(I \setminus F_\varepsilon) < \varepsilon$.

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \int_0^1 f_n - f \right| &\leq \lim_{n \rightarrow \infty} \int_0^1 |f_n - f| \\ &= \lim_{n \rightarrow \infty} \left(\int_{F_\varepsilon} |f_n - f| + \int_{I \setminus F_\varepsilon} |f_n - f| \right) \\ &= \int_{F_\varepsilon} \lim_{n \rightarrow \infty} |f_n - f| + \lim_{n \rightarrow \infty} \int_{I \setminus F_\varepsilon} |f_n - f| \quad \text{by uniform convergence} \\ &= 0 + \lim_{n \rightarrow \infty} \int_{I \setminus F_\varepsilon} |f_n - f|, \end{aligned}$$

so it suffices to show $\int_{I \setminus F_\varepsilon} |f_n - f| \xrightarrow{n \rightarrow \infty} 0$.

- We can obtain a bound using Holder's inequality with $p = q = 2$:

$$\begin{aligned}
\int_{I \setminus F_\varepsilon} |f_n - f| &\leq \left(\int_{I \setminus F_\varepsilon} |f_n - f|^2 \right)^{1/2} \left(\int_{I \setminus F_\varepsilon} 1^2 \right)^{1/2} \\
&= \left(\int_{I \setminus F_\varepsilon} |f_n - f|^2 \right)^{1/2} \mu(F_\varepsilon) \\
&\leq \|f_n - f\|_2 \mu(F_\varepsilon) \\
&\leq (\|f_n\|_2 + \|f\|_2) \mu(F_\varepsilon) \\
&\leq 2M \cdot \mu(F_\varepsilon)
\end{aligned}$$

where M is now a constant not depending on ε or n .

- Now take a nested sequence of sets F_ε with $\mu(F_\varepsilon) \rightarrow 0$ and applying continuity of measure yields the desired statement.

3.4 4

See S&S p.82.

3.4.1 a

\Rightarrow :

- Suppose f is a measurable function.
- Note that $\mathcal{A} = \{f(x) - t \geq 0\} \cap \{t \geq 0\}$.
- Define $F(x, t) = f(x)$, $G(x, t) = t$, which are cylinders on measurable functions and thus measurable.
- Define $H(x, y) = F(x, t) - G(x, t)$, which are linear combinations of measurable functions and thus measurable.
- Then $\mathcal{A} = \{H \geq 0\} \cap \{G \geq 0\}$ as a countable intersection of measurable sets, which is again measurable.

\Leftarrow :

- Suppose \mathcal{A} is a measurable set.
- Then FT on $\chi_{\mathcal{A}}$ implies that for almost every $x \in \mathbb{R}^n$, the x -slices \mathcal{A}_x are measurable and

$$\mathcal{A}_x := \{t \in \mathbb{R} \mid (x, t) \in \mathcal{A}\} = [0, f(x)] \implies m(\mathcal{A}_x) = f(x) - 0 = f(x)$$

- But $x \mapsto m(\mathcal{A}_x)$ is a measurable function, and is exactly the function $x \mapsto f(x)$, so f is measurable.

3.4.2 b

- Note

$$\begin{aligned}
\mathcal{A} &= \{(x, t) \in \mathbb{R}^n \times \mathbb{R} \mid 0 \leq t \leq f(x)\} \\
\mathcal{A}_t &= \{x \in \mathbb{R}^n \mid t \leq f(x)\}.
\end{aligned}$$

- Then

$$\begin{aligned}
 \int_{\mathbb{R}^n} f(x) \, dx &= \int_{\mathbb{R}^n} \int_0^{f(x)} 1 \, dt \, dx \\
 &= \int_{\mathbb{R}^n} \int_0^\infty \chi_{\mathcal{A}} \, dt \, dx \\
 &\stackrel{F.T.}{=} \int_0^\infty \int_{\mathbb{R}^n} \chi_{\mathcal{A}} \, dx \, dt \\
 &= \int_0^\infty m(\mathcal{A}_t) \, dt,
 \end{aligned}$$

where we just use that $\int \chi_{\mathcal{A}} = m(\mathcal{A})$

- By F.T., all of these integrals are equal.

Why is FT justified.

3.5 5

Concepts used:

- Holders' inequality: $\|fg\|_1 \leq \|f\|_p \|g\|_q$
- Riesz Representation for L^2 : If $\Lambda \in (L^2)^\vee$ then there exists a unique $g \in L^2$ such that $\Lambda(f) = \int fg$.
- $\|f\|_{L^\infty(X)} := \inf \left\{ t \geq 0 \mid |f(x)| \leq t \text{ almost everywhere} \right\}$.
- **Lemma:** $m(X) < \infty \implies L^p(X) \subset L^2(X)$.

Proof: Write Holder's inequality as $\|fg\|_1 \leq \|f\|_a \|g\|_b$ where $\frac{1}{a} + \frac{1}{b} = 1$, then

$$\|f\|_p^p = \| |f|^p \|_1 \leq \| |f|^p \|_a \|1\|_b.$$

Now take $a = \frac{2}{p}$ and this reduces to

$$\begin{aligned}
 \|f\|_p^p &\leq \|f\|_2^p m(X)^{\frac{1}{p}} \\
 \implies \|f\|_p &\leq \|f\|_2 \cdot O(m(X)) < \infty.
 \end{aligned}$$

3.5.1 a

- Note $X = [0, 1] \implies m(X) = 1$.
- By Holder's inequality with $p = q = 2$,

$$\|f\|_1 = \|f \cdot 1\|_1 \leq \|f\|_2 \cdot \|1\|_2 = \|f\|_2 \cdot m(X)^{\frac{1}{2}} = \|f\|_2,$$

- Thus $L^2(X) \subseteq L^1(X)$
- Since they share a common dense subset (simple functions) L^2 is dense in L^1

What theorem is this using?

3.5.2 b

Let $\Lambda \in L^1(X)^\vee$ be arbitrary.

(i): Existence of g Representing Λ .

- Let $f \in L^2 \subseteq L^1$ be arbitrary
- Claim: $\Lambda \in L^1(X)^\vee \implies \Lambda \in L^2(X)^\vee$.
 - Suffices to show that $\|\Gamma\|_{L^2(X)^\vee} := \sup_{\|f\|_2=1} |\Gamma(f)| < \infty$, since bounded implies continuous.
 - By the lemma, $\|f\|_1 \leq C\|f\|_2$ for some constant $C \approx m(X)$.
 - Note

$$\|\Lambda\|_{L^1(X)^\vee} := \sup_{\|f\|_1=1} |\Lambda(f)|$$

- Define $\hat{f} = \frac{f}{\|f\|_1}$ so $\|\hat{f}\|_1 = 1$
- Since $\|\Lambda\|_{1^\vee}$ is a supremum over *all* $f \in L^1(X)$ with $\|f\|_1 = 1$,

$$|\Lambda(\hat{f})| \leq \|\Lambda\|_{(L^1(X))^\vee},$$

- Then

$$\begin{aligned} \frac{|\Lambda(f)|}{\|f\|_1} &= |\Lambda(\hat{f})| \leq \|\Lambda\|_{L^1(X)^\vee} \\ \implies |\Lambda(f)| &\leq \|\Lambda\|_{1^\vee} \cdot \|f\|_1 \\ &\leq \|\Lambda\|_{1^\vee} \cdot C\|f\|_2 < \infty \quad \text{by assumption,} \end{aligned}$$

- So $\Lambda \in (L^2)^\vee$.
- Now apply Riesz Representation for L^2 : there is a $g \in L^2$ such that

$$f \in L^2 \implies \Lambda(f) = \langle f, g \rangle := \int_0^1 f(x) \overline{g(x)} dx.$$

(ii): g is in L^∞

- It suffices to show $\|g\|_{L^\infty(X)} < \infty$.
- Since we're assuming $\|\Gamma\|_{L^1(X)^\vee} < \infty$, it suffices to show the stated equality.
- Claim: $\|\Lambda\|_{L^1(X)^\vee} = \|g\|_{L^\infty(X)}$

- The result follows because Λ was assumed to be in $L^1(X)^\vee$, so $\|\Lambda\|_{L^1(X)^\vee} < \infty$.

Is this assumed..?
Or did we show
it..?

– \leq :

$$\begin{aligned}
\|\Lambda\|_{L^1(X)^\vee} &= \sup_{\|f\|_1=1} |\Lambda(f)| \\
&= \sup_{\|f\|_1=1} \left| \int_X f \bar{g} \right| \quad \text{by (i)} \\
&= \sup_{\|f\|_1=1} \int_X |f \bar{g}| \\
&:= \sup_{\|f\|_1=1} \|fg\|_1 \\
&\leq \sup_{\|f\|_1=1} \|f\|_1 \|g\|_\infty \quad \text{by Holder with } p=1, q=\infty \\
&= \|g\|_\infty,
\end{aligned}$$

– \geq :

- * Suppose toward a contradiction that $\|g\|_\infty > \|\Lambda\|_{L^1(X)^\vee}$.
- * Then there exists some $E \subseteq X$ with $m(E) > 0$ such that

$$x \in E \implies |g(x)| > \|\Lambda\|_{L^1(X)^\vee}.$$

- * Define

$$h = \frac{1}{m(E)} \frac{\bar{g}}{|g|} \chi_E.$$

- * Note $\|h\|_{L^1(X)} = 1$.
- * Then

$$\begin{aligned}
\Lambda(h) &= \int_X hg \\
&:= \int_X \frac{1}{m(E)} \frac{g\bar{g}}{|g|} \chi_E \\
&= \frac{1}{m(E)} \int_E |g| \\
&\geq \frac{1}{m(E)} \|g\|_\infty m(E) \\
&= \|g\|_\infty \\
&> \|\Lambda\|_{L^1(X)^\vee},
\end{aligned}$$

a contradiction since $\|\Lambda\|_{L^1(X)^\vee}$ is the supremum over all h_α with $\|h_\alpha\|_{L^1(X)} = 1$.

4 Fall 2018

4.1 1

Concepts used:

- Uniform continuity.

Show a stronger statement: $f(x) = \frac{1}{x}$ is uniformly continuous on any interval of the form (c, ∞) where $c > 0$.

- Note that

$$|x|, |y| > c > 0 \implies |xy| = |x||y| > c^2 \implies \frac{1}{|xy|} < \frac{1}{c^2}.$$

- Letting ε be arbitrary, choose $\delta < \varepsilon c^2$.
- Note that δ does not depend on x, y .
- Then

$$\begin{aligned} |f(x) - f(y)| &= \left| \frac{1}{x} - \frac{1}{y} \right| \\ &= \frac{|x - y|}{xy} \\ &\leq \frac{\delta}{xy} \\ &< \frac{\delta}{c^2} \\ &< \varepsilon, \end{aligned}$$

which shows uniform continuity.

To see that f is not uniformly continuous when $c = 0$:

Note: negating uniform continuity says $\exists \varepsilon > 0$ such that $\forall \delta(\varepsilon)$ there exist x, y such that $|x - y| < \delta$ and $|f(x) - f(y)| > \varepsilon$.

- Let $\varepsilon < 1$.
- Let $x_n = \frac{1}{n}$ for $n \geq 1$.
- Choose n large enough such that $|x_n - x_{n+1}| = \frac{1}{n} - \frac{1}{n+1} < \delta$.
 - Why this can be done: by the archimedean property of \mathbb{R} , choose n such that $\frac{1}{n} < \varepsilon$.
 - Then

$$\frac{1}{n} - \frac{1}{n+1} = \frac{1}{n(n+1)} \leq \frac{1}{n} < \varepsilon \quad \text{since } n+1 > 1.$$

- Note $f(x_n) = n$ and thus

$$|f(x_n) - f(x_{n+1})| = n - (n+1) = 1 > \varepsilon.$$

■

4.2 2

Concepts used:

- Definition of measurability: there exists an open $O \supset E$ such that $m_*(O \setminus E) < \varepsilon$ for all $\varepsilon > 0$.
- Theorem: E is Lebesgue measurable iff there exists a closed set $F \subseteq E$ such that $m_*(E \setminus F) < \varepsilon$ for all $\varepsilon > 0$.
- Every F_σ, G_δ is Borel.
- Claim: E is measurable \iff for every ε there exist $F_\varepsilon \subset E \subset G_\varepsilon$ with F_ε closed and G_ε open and $m(G_\varepsilon \setminus E) < \varepsilon$ and $m(E \setminus F_\varepsilon) < \varepsilon$.
 - Proof: existence of G_ε is the definition of measurability.
 - Existence of F_ε : ?
- Claim: E is measurable \implies there exists an open $O \supseteq E$ such that $m(O \setminus E) = 0$.
 - Since E is measurable, for each $n \in \mathbb{N}$ choose $G_n \supseteq E$ such that $m_*(G_n \setminus E) < \frac{1}{n}$.
 - Set $O_N := \bigcap_{n=1}^N G_n$ and $O := \bigcap_{n=1}^\infty G_n$.
 - Suppose E is bounded.
 - * Note $O_N \searrow O$ and $m_*(O_1) < \infty$ if E is bounded, since in this case

$$m_*(G_n \setminus E) = m_*(G_1) - m_*(E) < 1 \iff m_*(G_1) < m_*(E) + \frac{1}{n} < \infty.$$

- * Note $O_N \setminus E \searrow O \setminus E$ since $O_N \setminus E := O_N \cap E^c \supseteq O_{N+1} \cap E^c$ for all N , and again $m_*(O_1 \setminus E) < \infty$.
- * So it's valid to apply continuity of measure from above:

$$\begin{aligned} m_*(O \setminus E) &= \lim_{N \rightarrow \infty} m_*(O_N \setminus E) \\ &\leq \lim_{N \rightarrow \infty} m_*(G_N \setminus E) \\ &= \lim_{N \rightarrow \infty} \frac{1}{N} = 0, \end{aligned}$$

where the inequality uses subadditivity on $\bigcap_{n=1}^N G_n \subseteq G_N$

- Suppose E is unbounded.
 - * Write $E^k = E \cap [k, k+1]^d \subset \mathbb{R}^d$ as the intersection of E with an annulus, and note that $E = \coprod_{k \in \mathbb{N}} E_k$.
 - * Each E_k is bounded, so apply the previous case to obtain $O_k \supseteq E_k$ with $m(O_k \setminus E_k) = 0$.
 - * So write $O_k = E_k \coprod N_k$ where $N_k := O_k \setminus E_k$ is a null set.
 - * Define $O = \bigcup_{k \in \mathbb{N}} O_k$, note that $E \subseteq O$.
 - * Now note

$$\begin{aligned} O \setminus E &= \left(\coprod_k O_k \right) \setminus \left(\coprod_k E_k \right) \\ &\subseteq \coprod_k (O_k \setminus E_k) \\ \implies m_*(O \setminus E) &\leq m_*\left(\coprod_k (O_k \setminus E_k) \right) = 0, \end{aligned}$$

since any countable union of null sets is again null.

- So $O \supseteq E$ with $m(O \setminus E) = 0$.
- Theorem: since E is measurable, E^c is measurable

- Proof: It suffices to write E^c as the union of two measurable sets, $E^c = S \cup (E^c - S)$, where S is to be determined.
- We'll produce an S such that $m_*(E^c - S) = 0$ and use the fact that any subset of a null set is measurable.
- Since E is measurable, for every $\varepsilon > 0$ there exists an open $\mathcal{O}_\varepsilon \supseteq E$ such that $m_*(\mathcal{O}_\varepsilon \setminus E) < \varepsilon$.
- Take the sequence $\left\{ \varepsilon_n := \frac{1}{n} \right\}$ to produce a sequence of sets \mathcal{O}_n .
- Note that each \mathcal{O}_n^c is closed and

$$\mathcal{O}_n \supseteq E \iff \mathcal{O}_n^c \subseteq E^c.$$

- Set $S := \bigcup_n \mathcal{O}_n^c$, which is a union of closed sets, thus an F_σ set, thus Borel, thus measurable.
- Note that $S \subseteq E^c$ since each $\mathcal{O}_n \subseteq E^c$.
- Note that

$$\begin{aligned} E^c \setminus S &:= E^c \setminus \left(\bigcup_{n=1}^{\infty} \mathcal{O}_n^c \right) \\ &:= E^c \cap \left(\bigcup_{n=1}^{\infty} \mathcal{O}_n^c \right)^c \quad \text{definition of set minus} \\ &= E^c \cap \left(\bigcap_{n=1}^{\infty} \mathcal{O}_n \right)^c \quad \text{De Morgan's law} \\ &= E^c \cup \left(\bigcap_{n=1}^{\infty} \mathcal{O}_n \right) \\ &:= \left(\bigcap_{n=1}^{\infty} \mathcal{O}_n \right) \setminus E \\ &\subseteq \mathcal{O}_N \setminus E \quad \text{for every } N \in \mathbb{N}. \end{aligned}$$

- Then by subadditivity,

$$m_*(E^c \setminus S) \leq m_*(\mathcal{O}_N \setminus E) \leq \frac{1}{N} \quad \forall N \implies m_*(E^c \setminus S) = 0.$$

- Thus $E^c \setminus S$ is measurable.

4.2.1 Indirect Proof

- Since E is measurable, E^c is measurable.
- Since E^c is measurable exists an open $\mathcal{O} \supseteq E^c$ such that $m(\mathcal{O} \setminus E^c) = 0$.
- Set $B := \mathcal{O}^c$, then $\mathcal{O} \supseteq E^c \iff \mathcal{O}^c \subseteq E \iff B \subseteq E$.
- Computing measures yields

$$E \setminus B := E \setminus \mathcal{O}^c := E \cap (\mathcal{O}^c)^c = E \cap \mathcal{O} = \mathcal{O} \cap (E^c)^c := \mathcal{O} \setminus E^c,$$

thus $m(E \setminus B) = m(\mathcal{O} \setminus E^c) = 0$.

- Since \mathcal{O} is open, B is closed and thus Borel.

4.2.2 Direct Proof

?

Try to construct the set.

4.3 3

Concepts used:

- Mean Value Theorem
- DCT

$$\begin{aligned}\frac{\partial}{\partial t} F(t) &= \frac{\partial}{\partial t} \int_{\mathbb{R}} f(x) \cos(xt) \, dx \\ &\stackrel{DCT}{=} \int_{\mathbb{R}} f(x) \frac{\partial}{\partial t} \cos(xt) \, dx \\ &= \int_{\mathbb{R}} x f(x) \cos(xt) \, dx,\end{aligned}$$

so it only remains to justify the DCT.

- Fix t , then let $t_n \rightarrow t$ be arbitrary.
- Define

$$h_n(x, t) = f(x) \left(\frac{\cos(tx) - \cos(t_n x)}{t_n - t} \right) \xrightarrow{n \rightarrow \infty} \frac{\partial}{\partial t} (f(x) \cos(xt))$$

since $\cos(tx)$ is differentiable in t and this is the limit definition of differentiability.

- Note that

$$\begin{aligned}\frac{\partial}{\partial t} \cos(tx) &:= \lim_{t_n \rightarrow t} \frac{\cos(tx) - \cos(t_n x)}{t_n - t} \\ &\stackrel{MVT}{=} \frac{\partial}{\partial t} \cos(tx) \Big|_{t=\xi_n} \quad \text{for some } \xi_n \in [t, t_n] \text{ or } [t_n, t] \\ &= x \sin(\xi_n x)\end{aligned}$$

where $\xi_n \xrightarrow{n \rightarrow \infty} t$ since wlog $t_n \leq \xi_n \leq t$ and $t_n \nearrow t$.

- We then have

$$|h_n(x)| = |f(x)x \sin(\xi_n x)| \leq |xf(x)| \quad \text{since } |\sin(\xi_n x)| \leq 1$$

for every x and every n .

- Since $xf(x) \in L^1(\mathbb{R})$ by assumption, the DCT applies.

4.4 4

Case of characteristic function

- First suppose $f(x) = \chi_{[0,1]}(x)$.

- Note that $\sin(nx)$ has a period of $2\pi/n$, and thus $\left\lfloor \frac{n}{2\pi} \right\rfloor$ full periods in $[0, 1]$.
- Taking the absolute value yields a new function with half the period, so a period of π/n and $\lfloor \pi/n \rfloor$ full periods in $[0, 1]$.
- We can compute the integral over one full period (which is independent of *which* period is chosen), and since $\sin(x)$ is positive and agrees with $|\sin(nx)|$ on the first period, we have

$$\begin{aligned} \int_{\text{One Period}} |\sin(nx)| dx &= \int_0^{\pi/n} \sin(nx) dx \\ &= \frac{1}{n} \int_0^\pi \sin(u) du \quad u = nx \\ &= \frac{1}{n} - \cos(u) \Big|_0^\pi \\ &= \frac{2}{n}. \end{aligned}$$

- Then break the integral up into integrals over periods P_1, P_2, \dots, P_N where $N := \lfloor n/\pi \rfloor$:

$$\begin{aligned} \int_0^1 |\sin(nx)| dx &= \left(\sum_{j=1}^N \int_{P_j} |\sin(nx)| dx \right) + \int_{N\lfloor \pi/n \rfloor}^1 |\sin(nx)| dx \\ &= \left(\sum_{j=1}^N \frac{2}{n} \right) + \int_{N\lfloor \pi/n \rfloor}^1 |\sin(nx)| dx \\ &= N \left(\frac{2}{n} \right) + \int_{N\lfloor \pi/n \rfloor}^1 |\sin(nx)| dx \\ &:= \left\lfloor \frac{n}{\pi} \right\rfloor \frac{2}{n} + \int_{N\lfloor \pi/n \rfloor}^1 |\sin(nx)| dx \\ &= \frac{2}{\pi} + \int_{N\lfloor \pi/n \rfloor}^1 |\sin(nx)| dx \\ &:= \frac{2}{\pi} + R(n) \end{aligned}$$

so it suffices to show that $R(n) \xrightarrow{n \rightarrow \infty} 0$.

- Showing this: ???????????

General case

4.5 5

Concepts used:

- Claim: If $E \subseteq \mathbb{R}^a \times \mathbb{R}^b$ is a measurable set, then for almost every $y \in \mathbb{R}^b$, the slice E^y is measurable and

$$m(E) = \int_{\mathbb{R}^b} m(E^y) dy.$$

- Set $g = \chi_E$, which is non-negative and measurable, so apply Tonelli.

Need to justify removing floor function and cancellation.

No clue how to show this.

Not sure. Approximate f by simple functions...?

- Conclude that $g^y = \chi_{E^y}$ is measurable, the function $y \mapsto \int g^y(x) dx$ is measurable, and $\int \int g^y(x) dx dy = \int g$.
- But $\int g = m(E)$ and $\int \int g^y(x) dx dy = \int m(E^y) dy$.

Solution

Note: f is a function $\mathbb{R} \rightarrow \mathbb{R}$ in the original problem, but here I've assumed $f : \mathbb{R}^n \rightarrow \mathbb{R}$.

- Since $f \geq 0$, set

$$E := \{(x, t) \in \mathbb{R}^n \times \mathbb{R} \mid f(x) > t\} = \{(x, t) \in \mathbb{R}^n \times \mathbb{R} \mid 0 \leq t < f(x)\}.$$

- Claim: since f is measurable, E is measurable and thus $m(E)$ makes sense.
 - Since f is measurable, $F(x, t) := t - f(x)$ is measurable on $\mathbb{R}^n \times \mathbb{R}$.
 - Then write $E = \{F < 0\} \cap \{t \geq 0\}$ as an intersection of measurable sets.
- We have slices

$$E^t := \{x \in \mathbb{R}^n \mid (x, t) \in E\} = \{x \in \mathbb{R}^n \mid 0 \leq t < f(x)\}$$

$$E^x := \{t \in \mathbb{R} \mid (x, t) \in E\} = \{t \in \mathbb{R} \mid 0 \leq t < f(x)\} = [0, f(x)).$$

- E_t is precisely the set that appears in the original RHS integrand.
- $m(E^x) = f(x)$.
- Claim: χ_E satisfies the conditions of Tonelli, and thus $m(E) = \int \chi_E$ is equal to any iterated integral.
 - Non-negative: clear since $0 \leq \chi_E \leq 1$
 - Measurable: characteristic functions of measurable sets are measurable.
- Conclude:
 1. For almost every x , E^x is a measurable set, $x \mapsto m(E^x)$ is a measurable function, and $m(E) = \int_{\mathbb{R}^n} m(E^x) dx$
 2. For almost every t , E^t is a measurable set, $t \mapsto m(E^t)$ is a measurable function, and $m(E) = \int_{\mathbb{R}} m(E^t) dt$
- On one hand,

$$\begin{aligned}
 m(E) &= \int_{\mathbb{R}^{n+1}} \chi_E(x, t) \\
 &= \int_{\mathbb{R}} \int_{\mathbb{R}^n} \chi_E(x, t) dt dx \quad \text{by Tonelli} \\
 &= \int_{\mathbb{R}^n} m(E^x) dx \quad \text{first conclusion} \\
 &= \int_{\mathbb{R}^n} f(x) dx.
 \end{aligned}$$

- On the other hand,

$$\begin{aligned}
 m(E) &= \int_{\mathbb{R}^{n+1}} \chi_E(x, t) \\
 &= \int_{\mathbb{R}} \int_{\mathbb{R}^n} \chi_E(x, t) dx dt \quad \text{by Tonelli} \\
 &= \int_{\mathbb{R}} m(E^t) dt \quad \text{second conclusion.}
 \end{aligned}$$

- Thus

$$\int_{\mathbb{R}^n} f dx = m(E) = \int_{\mathbb{R}} m(E^t) dt = \int_{\mathbb{R}} m(\{x \mid f(x) > t\}).$$

■

4.6 6

- Note that $x^{\frac{1}{n}} \xrightarrow{n \rightarrow \infty} 1$ for any $0 < x < \infty$.
- Thus the integrand converges to $\frac{1}{e^x}$, which is integrable on $(0, \infty)$ and integrates to 1.
- Break the integrand up:

$$\int_0^\infty \frac{1}{(1 + \frac{x}{n})^n x^{\frac{1}{n}}} dx = \int_0^1 \frac{1}{(1 + \frac{x}{n})^n x^{\frac{1}{n}}} dx = \int_1^\infty \frac{1}{(1 + \frac{x}{n})^n x^{\frac{1}{n}}} dx.$$

5 Spring 2018

5.1 1

Concepts used:

- Borel-Cantelli: If $\{E_k\}_{k \in \mathbb{Z}} \subset 2^{\mathbb{R}}$ is a countable collection of Lebesgue measurable sets with $\sum_{k \in \mathbb{Z}} m(E_k) < \infty$, then almost every $x \in \mathbb{R}$ is in *at most finitely* many E_k .
 - Equivalently (?), $m(\limsup_{k \rightarrow \infty} E_k) = 0$, where $\limsup_{k \rightarrow \infty} E_k = \bigcap_{k=1}^\infty \bigcup_{j \geq k} E_j$, the elements which are in E_k for infinitely many k .

Solution:

- Strategy: Borel-Cantelli.
- We'll show that $m(E) \cap [n, n+1] = 0$ for all $n \in \mathbb{Z}$; then the result follows from

$$m(E) = m\left(\bigcup_{n \in \mathbb{Z}} E \cap [n, n+1]\right) \leq \sum_{n=1}^\infty m(E \cap [n, n+1]) = 0.$$

- By translation invariance of measure, it suffices to show $m(E \cap [0, 1]) = 0$.

– So WLOG, replace E with $E \cap [0, 1]$.

- Define

$$E_j := \left\{ x \in [0, 1] \mid \exists p \in \mathbb{Z}^{\geq 0} \text{ s.t. } \left| x - \frac{p}{j} \right| < \frac{1}{j^3} \right\}.$$

– Note that $E_j \subseteq \coprod_{p \in \mathbb{Z}^{\geq 0}} B_{j^{-3}}\left(\frac{p}{j}\right)$, i.e. a union over integers p of intervals of radius $1/j^3$ around the points p/j . Since $1/j^3 < 1/j$, this union is in fact disjoint.

- Importantly, note that

$$\limsup_{j \rightarrow \infty} E_j := \bigcap_{n=1}^{\infty} \bigcup_{j=n}^{\infty} E_j = E$$

since

$$x \in \limsup_j E_j \iff x \in E_j \text{ for infinitely many } j$$

$$\iff \text{there are infinitely many } j \text{ for which there exist a } p \text{ such that } \left| x - \frac{p}{j} \right| < j^{-3}$$

$$\iff \text{there are infinitely many such pairs } p, j$$

$$\iff x \in E.$$

- Intersecting with $[0, 1]$, we can write E_j as a union of intervals:

$$E_j = (0, j^{-3}) \coprod B_{j^{-3}}\left(\frac{1}{j}\right) \coprod B_{j^{-3}}\left(\frac{2}{j}\right) \coprod \cdots \coprod B_{j^{-3}}\left(\frac{j-1}{j}\right) \coprod (1 - j^{-3}, 1),$$

where we've separated out the “boundary” terms to emphasize that they are balls about 0 and 1 intersected with $[0, 1]$.

- Since E_j is a union of open sets, it is Borel and thus Lebesgue measurable.
- Computing the measure of E_j :
 - For a fixed j , there are exactly $j + 1$ possible choices for a numerator $(0, 1, \dots, j)$, thus there are exactly $j + 1$ sets appearing in the above decomposition.
 - The first and last intervals are length $\frac{1}{j^3}$
 - The remaining $(j + 1) - 2 = j - 1$ intervals are twice this length, $\frac{2}{j^3}$
 - Thus

$$m(E_j) = 2\left(\frac{1}{j^3}\right) + (j - 1)\left(\frac{2}{j^3}\right) = \frac{2}{j^2}$$

- Note that

$$\sum_{j \in \mathbb{N}} m(E_j) = 2 \sum_{j \in \mathbb{N}} \frac{1}{j^2} < \infty,$$

which converges by the p -test for sums.

- But then

$$\begin{aligned}
m(E) &= m(\limsup_j E_j) \\
&= m(\bigcap_{n \in \mathbb{N}} \bigcup_{j \geq n} E_j) \\
&\leq m(\bigcup_{j \geq N} E_j) \quad \text{for every } N \\
&\leq \sum_{j \geq N} m(E_j) \\
&\xrightarrow{N \rightarrow \infty} 0 \quad .
\end{aligned}$$

- Thus E is measurable as a subset of a null set and $m(E) = 0$.

■

5.2 2

5.2.1 a

Claim: f_n does not converge uniformly to its limit.

- Note each $f_n(x)$ is clearly continuous on $(0, \infty)$, since it is a quotient of continuous functions where the denominator is never zero.
- Note

$$x < 1 \implies x^n \xrightarrow{n \rightarrow \infty} 0 \quad \text{and} \quad x > 1 \implies x^n \xrightarrow{n \rightarrow \infty} \infty.$$

- Thus

$$f_n(x) = \frac{x}{1+x^n} \xrightarrow{n \rightarrow \infty} f(x) := \begin{cases} x, & 0 \leq x < 1 \\ \frac{1}{2}, & x = 1 \\ 0, & x > 1 \end{cases}.$$

- If $f_n \rightarrow f$ uniformly on $[0, \infty)$, it would converge uniformly on every subset and thus uniformly on $(0, \infty)$.
 - Then f would be a uniform limit of continuous functions on $(0, \infty)$ and thus continuous on $(0, \infty)$.
 - By uniqueness of limits, f_n would converge to the pointwise limit f above, which is not continuous at $x = 1$, a contradiction.

5.2.2 b

- If the DCT applies, interchange the limit and integral:

$$\begin{aligned}
 \lim_{n \rightarrow \infty} \int_0^\infty f_n(x) dx &= \int_0^\infty \lim_{n \rightarrow \infty} f_n(x) dx \quad \text{DCT} \\
 &= \int_0^\infty f(x) dx \\
 &= \int_0^1 x dx + \int_1^\infty 0 dx \\
 &= \frac{1}{2} x^2 \Big|_0^1 \\
 &= \frac{1}{2}.
 \end{aligned}$$

- To justify the DCT, write

$$\int_0^\infty f_n(x) dx = \int_0^1 f_n(x) dx + \int_1^\infty f_n(x) dx.$$

- f_n restricted to $(0, 1)$ is uniformly bounded by $g_0(x) = 1$ in the first integral, since

$$x \in [0, 1] \implies \frac{x}{1+x^n} < \frac{1}{1+x^n} < 1 := g(x)$$

so

$$\int_0^1 f_n(x) dx \leq \int_0^1 1 dx = 1 < \infty.$$

Also note that $g_0 \cdot \chi_{(0,1)} \in L^1((0, \infty))$.

- The f_n restricted to $(1, \infty)$ are uniformly bounded by $g_1(x) = \frac{1}{x^2}$ on $[1, \infty)$, since

$$x \in (1, \infty) \implies \frac{x}{1+x^n} \leq \frac{x}{x^n} = \frac{1}{x^{n-1}} \leq \frac{1}{x^2} \in L^1([1, \infty)) \text{ when } n \geq 3,$$

by the p -test for integrals.

- So set

$$g := g_0 \cdot \chi_{(0,1)} + g_1 \cdot \chi_{[1,\infty)},$$

then by the above arguments $g \in L^1((0, \infty))$ and $f_n \leq g$ everywhere, so the DCT applies.

5.3 3

Concepts used:

- $\|f\|_\infty := \inf_t \left\{ t \mid m\left(\left\{x \in \mathbb{R}^n \mid f(x) > t\right\}\right) = 0 \right\}$, i.e. this is the lowest upper bound that holds almost everywhere.

Solution:

- $\|f\|_p \leq \|f\|_\infty$:
 - Note $|f(x)| \leq \|f\|_\infty$ almost everywhere and taking p th powers preserves this inequality.
 - Thus

$$\begin{aligned}
 & |f(x)| \leq \|f\|_\infty \quad \text{a.e. by definition} \\
 \implies & |f(x)|^p \leq \|f\|_\infty^p \quad \text{for } p \geq 0 \\
 \implies & \|f\|_p^p = \int_X |f(x)|^p dx \\
 & \leq \int_X \|f\|_\infty^p dx \\
 & = \|f\|_\infty^p \int_X 1 dx \\
 & = \|f\|_\infty^p \cdot m(X) \quad \text{since the norm doesn't depend on } x \\
 & = \|f\|_\infty^p \quad \text{since } m(X) = 1.
 \end{aligned}$$

* Thus $\|f\|_p \leq \|f\|_\infty$ for all p and taking $\lim_{p \rightarrow \infty}$ preserves this inequality.

- $\|f\|_p \geq \|f\|_\infty$:
 - Fix $\varepsilon > 0$.
 - Define

$$S_\varepsilon := \{x \in \mathbb{R}^n \mid |f(x)| \geq \|f\|_\infty - \varepsilon\}.$$

* Note that $m(S_\varepsilon) > 0$; otherwise if $m(S_\varepsilon) = 0$, then $t := \|f\|_\infty - \varepsilon < \|f\|_\varepsilon$. But this produces a *smaller* upper bound almost everywhere than $\|f\|_\varepsilon$, contradicting the definition of $\|f\|_\varepsilon$ as an infimum over such bounds.

– Then

$$\begin{aligned}
 \|f\|_p^p &= \int_X |f(x)|^p dx \\
 &\geq \int_{S_\varepsilon} |f(x)|^p dx \quad \text{since } S_\varepsilon \subseteq X \\
 &\geq \int_{S_\varepsilon} (\|f\|_\infty - \varepsilon)^p dx \quad \text{since on } S_\varepsilon, |f| \geq \|f\|_\infty - \varepsilon \\
 &= (\|f\|_\infty - \varepsilon)^p \cdot m(S_\varepsilon) \quad \text{since the integrand is independent of } x \\
 &\geq 0 \quad \text{since } m(S_\varepsilon) > 0
 \end{aligned}$$

– Taking p th roots for $p \geq 1$ preserves the inequality, so

$$\implies \|f\|_p \geq (\|f\|_\infty - \varepsilon) \cdot m(S_\varepsilon)^{\frac{1}{p}} \xrightarrow{p \rightarrow \infty} \|f\|_\infty - \varepsilon \xrightarrow{\varepsilon \rightarrow 0} \|f\|_\infty$$

where we've used the fact that above arguments work

– Thus $\|f\|_p \geq \|f\|_\infty$.

■

5.4 4

5.4.1 Proof 1: Using Fourier Transforms

Concepts used:

- Weierstrass Approximation: A uniformly continuous function on a compact set can be uniformly approximated by polynomials.

Solution:

- Fix $k \in \mathbb{Z}$.
- Since $e^{2\pi i k x}$ is continuous on the compact interval $[0, 1]$, it is uniformly continuous.
- Thus there is a sequence of polynomials P_ℓ such that

$$P_{\ell,k} \xrightarrow{\ell \rightarrow \infty} e^{2\pi i k x} \text{ uniformly on } [0, 1].$$

- Note applying linearity to the assumption $\int f(x) x^n$, we have

$$\int f(x) x^n dx = 0 \quad \forall n \implies \int f(x) p(x) dx = 0$$

for any polynomial $p(x)$, and in particular for $P_{\ell,k}(x)$ for every ℓ and every k .

- But then

$$\begin{aligned} \langle f, e_k \rangle &= \int_0^1 f(x) e^{-2\pi i k x} dx \\ &= \int_0^1 f(x) \lim_{\ell \rightarrow \infty} P_\ell(x) dx \\ &= \lim_{\ell \rightarrow \infty} \int_0^1 f(x) P_\ell(x) dx \quad \text{by uniform convergence on a compact interval} \\ &= \lim_{\ell \rightarrow \infty} 0 \quad \text{by assumption} \\ &= 0 \quad \forall k \in \mathbb{Z}, \end{aligned}$$

so f is orthogonal to every e_k .

- Thus $f \in S^\perp := \text{span}_{\mathbb{C}} \{e_k\}_{k \in \mathbb{Z}}^\perp \subseteq L^2([0, 1])$, but since this is a basis, S is dense and thus $S^\perp = \{0\}$ in $L^2([0, 1])$.
- Thus $f \equiv 0$ in $L^2([0, 1])$, which implies that f is zero almost everywhere. ■

5.4.2 Alternative Proof

Concepts used

- $C^1([0, 1])$ is dense in $L^2([0, 1])$
- Polynomials are dense in $L^p(X, \mathcal{M}, \mu)$ for any $X \subseteq \mathbb{R}^n$ compact and μ a finite measure, for all $1 \leq p < \infty$.
 - Use Weierstrass Approximation, then uniform convergence implies $L^p(\mu)$ convergence by DCT.

Solution:

- By density of polynomials, for $f \in L^2([0, 1])$ choose $p_\varepsilon(x)$ such that $\|f - p_\varepsilon\| < \varepsilon$ by Weierstrass approximation.
- Then on one hand,

$$\begin{aligned}\|f(f - p_\varepsilon)\|_1 &= \|f^2\|_1 - \|f \cdot p_\varepsilon\|_1 \\ &= \|f^2\|_1 - 0 \quad \text{by assumption} \\ &= \|f\|_2^2.\end{aligned}$$

– Where we've used that $\|f^2\|_1 = \int |f^2| = \int |f|^2 = \|f\|_2^2$.

- On the other hand

$$\begin{aligned}\|f(f - p_\varepsilon)\| &\leq \|f\|_1 \|f - p_\varepsilon\|_\infty \quad \text{by Holder} \\ &\leq \varepsilon \|f\|_1 \\ &\leq \varepsilon \|f\|_2 \sqrt{m(X)} \\ &= \varepsilon \|f\|_2 \quad \text{since } m(X) = 1.\end{aligned}$$

– Where we've used that $\|fg\|_1 = \int |fg| = \int |f||g| \leq \int \|f\|_\infty |g| = \|f\|_\infty \|g\|_1$.

- Combining these,

$$\|f\|_2^2 \leq \|f\|_2 \varepsilon \implies \|f\|_2 < \varepsilon \longrightarrow 0, .$$

so $\|f\|_2 = 0$, which implies $f = 0$ almost everywhere.

5.5 5

Concepts used:

- $\int |f_n - f| \longrightarrow \iff \int f_n = \int f$.
- Fatou:

$$\begin{aligned}\int \liminf f_n &\leq \liminf \int f_n \\ \int \limsup f_n &\geq \limsup \int f_n.\end{aligned}$$

Solution:

- Since $\int |f_n| \xrightarrow{n \rightarrow \infty} \int |f|$, define

$$\begin{aligned}h_n &= |f_n - f| && \xrightarrow{n \rightarrow \infty} 0 \text{ a.e.} \\ g_n &= |f_n| + |f| && \xrightarrow{n \rightarrow \infty} 2|f| \text{ a.e.}\end{aligned}$$

– Note that $g_n - h_n \xrightarrow{n \rightarrow \infty} 2|f| - 0 = 2|f|$.

- Then

$$\begin{aligned}
\int 2|f| &= \int \liminf_n (g_n - h_n) \\
&= \int \liminf_n (g_n) + \int \liminf_n (-h_n) \\
&= \int \liminf_n (g_n) - \int \limsup_n (h_n) \\
&= \int 2|f| - \int \limsup_n (h_n) \\
&\leq \int 2|f| - \limsup_n \int h_n \quad \text{by Fatou,}
\end{aligned}$$

- Since $f \in L^1$, $\int 2|f| = 2\|f\|_1 < \infty$ and it makes sense to subtract it from both sides, thus

$$\begin{aligned}
0 &\leq -\limsup_n \int h_n \\
&:= -\limsup_n \int |f_n - f|.
\end{aligned}$$

which forces $\limsup_n \int |f_n - f| = 0$, since

- The integral of a nonnegative function is nonnegative, so $\int |f_n - f| \geq 0$.
- So $\left(-\int |f_n - f|\right) \leq 0$.
- But the above inequality shows $\left(-\int |f_n - f|\right) \geq 0$ as well.
- Since $\liminf_n \int h_n \leq \limsup_n \int h_n = 0$, $\lim_n \int h_n$ exists and is equal to zero.
- But then

$$\left| \int f_n - \int f \right| = \left| \int f_n - f \right| \leq \int |f_n - f|,$$

and taking $\lim_{n \rightarrow \infty}$ on both sides yields

$$\lim_{n \rightarrow \infty} \left| \int f_n - \int f \right| \leq \lim_{n \rightarrow \infty} \int |f_n - f| = 0,$$

$$\text{so } \lim_{n \rightarrow \infty} \int f_n = \int f.$$

■

6 Fall 2017

6.1 1

Note that $f(x) = e^x$ is entire and thus equal to its power series. So $f(x) = \sum_{j=0}^{\infty} \frac{1}{j!} x^j$.

Letting $f_N(x) = \sum_{j=1}^N \frac{1}{j!} x^j$, we have $f_N(x) \rightarrow f(x)$ pointwise on $(-\infty, \infty)$.

For any compact interval $[-M, M]$, we have

$$\begin{aligned} \|f_N(x) - f(x)\|_\infty &= \sup_{-M \leq x \leq M} \left| \sum_{j=N+1}^{\infty} \frac{1}{j!} x^j \right| \\ &\leq \sup_{-M \leq x \leq M} \sum_{j=N+1}^{\infty} \frac{1}{j!} |x|^j \\ &\leq \sum_{j=N+1}^{\infty} \frac{1}{j!} M^j \\ &\leq \sum_{j=0}^{\infty} \frac{1}{j!} M^j \\ &= e^M \\ &< \infty, \end{aligned}$$

so $f_N \rightarrow f$ uniformly on $[-M, M]$ by the M-test. Thus it converges on any bounded interval.

It does not converge on \mathbb{R} , since x^N is unbounded.

6.2 2

6.2.1 a

It suffices to consider the bounded case, i.e. $E \subseteq B_M(0)$ for some M . Then write $E_n = B_n(0) \cap E$ and apply the theorem to E_n , and by subadditivity, $m^*(E) = m^*\left(\bigcup_n E_n\right) \leq \sum_n m^*(E_n) = 0$.

Lemma: $f(x) = x^2, f^{-1}(x) = \sqrt{x}$ are Lipschitz on any compact subset of $[0, \infty)$.

Proof: Let $g = f$ or f^{-1} . Then $g \in C^1([0, M])$ for any M , so g is differentiable and g' is continuous. Since g' is continuous on a compact interval, it is bounded, so $|g'(x)| \leq L$ for all x . Applying the MVT,

$$|f(x) - f(y)| = |f'(c)| |x - y| \leq L |x - y|.$$

Lemma: If g is Lipschitz on \mathbb{R}^n , then $m(E) = 0 \implies m(g(E)) = 0$.

Proof: If g is Lipschitz, then

$$g(B_r(x)) \subseteq B_{Lr}(x),$$

which is a dilated ball/cube, and so

$$m^*(B_{Lr}(x)) \leq L^n \cdot m^*(B_r(x)).$$

Now choose $\{Q_j\} \rightrightarrows E$; then $\{g(Q_j)\} \rightrightarrows g(E)$.

By the above observation,

$$|g(Q_j)| \leq L^n |Q_j|,$$

and so

$$m^*(g(E)) \leq \sum_j |g(Q_j)| \leq \sum_j L^n |Q_j| = L^n \sum_j |Q_j| \rightarrow 0.$$

Now just take $g(x) = x^2$ for one direction, and $g(x) = f^{-1}(x) = \sqrt{x}$ for the other. ■

6.2.2 b

Lemma: E is measurable iff $E = K \coprod N$ for some K compact, N null.

Write $E = K \coprod N$ where K is compact and N is null.

Then $\varphi^{-1}(E) = \varphi^{-1}(K \coprod N) = \varphi^{-1}(K) \coprod \varphi^{-1}(N)$.

Since $\varphi^{-1}(N)$ is null by part (a) and $\varphi^{-1}(K)$ is the preimage of a compact set under a continuous map and thus compact, $\varphi^{-1}(E) = K' \coprod N'$ where K' is compact and N' is null, so $\varphi^{-1}(E)$ is measurable.

So φ is a measurable function, and thus yields a well-defined map $\mathcal{L}(\mathbb{R}) \rightarrow \mathcal{L}(\mathbb{R})$ since it preserves measurable sets. Restricting to $[0, \infty)$, f is bijection, and thus so is φ . ■

6.3 3

From homework: E is Lebesgue measurable iff there exists a finite union of closed cubes A such that $m(E \Delta A) < \varepsilon$.

It suffices to show that S is dense in simple functions, and since simple functions are *finite* linear combinations of characteristic functions, it suffices to show this for χ_A for A a measurable set.

Let $s = \chi_A$. By regularity of the Lebesgue measure, choose an open set $O \supseteq A$ such that $m(O \setminus A) < \varepsilon$.

O is an open subset of \mathbb{R} , and thus $O = \coprod_{j \in \mathbb{N}} I_j$ is a disjoint union of countably many open intervals.

Now choose N large enough such that $m(O \Delta I_{N,n}) < \varepsilon = \frac{1}{n}$ where we define $I_{N,n} := \coprod_{j=1}^N I_j$.

Now define $f_n = \chi_{I_{N,n}}$, then

$$\|s - f_n\|_1 = \int |\chi_A - \chi_{I_{N,n}}| = m(A \Delta I_{N,n}) \xrightarrow{n \rightarrow \infty} 0.$$

Since any simple function is a finite linear combination of χ_{A_i} , we can do this for each i to extend this result to all simple functions. But simple functions are dense in L^1 , so S is dense in L^1 .

6.4 4**6.4.1 a**

Let $G(x) = \sum_{n=1}^{\infty} nx(1-x)^n$. Applying the ratio test, we have

$$\left| \frac{(n+1)x(1-x)^{n+1}}{nx(1-x)^n} \right| = \frac{n+1}{n} |1-x| \xrightarrow{n \rightarrow \infty} |1-x| < 1 \iff 0 \leq x \leq 2,$$

and in particular, this series converges on $[0, 2]$. Thus its terms go to zero, and $nx(1-x)^n \rightarrow 0$ on $[0, 1] \subset [0, 2]$.

To see that the convergence is not uniform, let $x_n = \frac{1}{n}$ and $\varepsilon > \frac{1}{e}$, then

$$\sup_{x \in [0,1]} |nx(1-x)^n - 0| \geq |nx_n(1-x_n)^n| = \left| \left(1 - \frac{1}{n}\right)^n \right| \xrightarrow{n \rightarrow \infty} e^{-1} > \varepsilon.$$

6.4.2 b

Note: could use the first part with $\sin(x) \leq x$, but then integral ends up more complicated.

Noting that $\sin(x) \leq 1$, we have We have

$$\begin{aligned} \left| \int_0^1 n(1-x)^n \sin(x) \right| &\leq \int_0^1 |n(1-x)^n \sin(x)| \\ &\leq \int_0^1 |n(1-x)^n| \\ &= n \int_0^1 (1-x)^n \\ &= -\frac{n(1-x)^{n+1}}{n+1} \\ &\xrightarrow{n \rightarrow \infty} 0. \end{aligned}$$

6.5 5**6.5.1 a**

Lemma: If $\varphi \in C_c^1$, then $(f * \varphi)' = f * \varphi'$ almost everywhere.

Silly Proof:

$$\begin{aligned} \mathcal{F}((f * \varphi)') &= 2\pi i \xi \mathcal{F}(f * \varphi) \\ &= 2\pi i \xi \mathcal{F}(f) \mathcal{F}(\varphi) \\ &= \mathcal{F}(f) \cdot (2\pi i \xi \mathcal{F}(\varphi)) \\ &= \mathcal{F}(f) \cdot \mathcal{F}(\varphi') \\ &= \mathcal{F}(f * \varphi'). \end{aligned}$$

Actual proof:

$$\begin{aligned}
(f * \varphi)'(x) &= (\varphi * f)'(x) \\
&= \lim_{h \rightarrow 0} \frac{(\varphi * f)'(x+h) - (\varphi * f)'(x)}{h} \\
&= \lim_{h \rightarrow 0} \int \frac{\varphi(x+h-y) - \varphi(x-y)}{h} f(y) \\
&\stackrel{DCT}{=} \int \lim_{h \rightarrow 0} \frac{\varphi(x+h-y) - \varphi(x-y)}{h} f(y) \\
&= \int \varphi'(x-y) f(y) \\
&= (\varphi' * f)(x) \\
&= (f * \varphi')(x).
\end{aligned}$$

To see that the DCT is justified, we can apply the MVT on the interval $[0, h]$ to f to obtain

$$\frac{\varphi(x+h-y) - \varphi(x-y)}{h} = \varphi'(c) \quad c \in [0, h],$$

and since φ' is continuous and compactly supported, φ' is bounded by some $M < \infty$ by the extreme value theorem and thus

$$\begin{aligned}
\int \left| \frac{\varphi(x+h-y) - \varphi(x-y)}{h} f(y) \right| &= \int |\varphi'(c) f(y)| \\
&\leq \int |M| |f| \\
&= |M| \int |f| < \infty,
\end{aligned}$$

since $f \in L^1$ by assumption, so we can take $g := |M||f|$ as the dominating function.

Applying this theorem infinitely many times shows that $f * \varphi$ is smooth.

To see that $f * \varphi$ is compactly supported, approximate f by a *continuous* compactly supported function h , so $\|h - f\|_1 \xrightarrow{L^1} 0$.

Now let $g_x(y) = \varphi(x-y)$, and note that $\text{supp}(g) = x - \text{supp}(\varphi)$ which is still compact.

But since $\text{supp}(h)$ is bounded, there is some N such that

$$|x| > N \implies A_x := \text{supp}(h) \cap \text{supp}(g_x) = \emptyset$$

and thus

$$\begin{aligned}
(h * \varphi)(x) &= \int_{\mathbb{R}} \varphi(x-y) h(y) dy \\
&= \int_{A_x} g_x(y) h(y) \\
&= 0,
\end{aligned}$$

so $\{x \mid f * g(x) = 0\}$ is open, and its complement is closed and bounded and thus compact.

6.5.2 b

$$\begin{aligned}
 \|f * K_j - f\|_1 &= \int \left| \int f(x-y)K_j(y) dy - f(x) \right| dx \\
 &= \int \left| \int f(x-y)K_j(y) dy - \int f(x)K_j(y) dy \right| dx \\
 &= \int \left| \int (f(x-y) - f(x))K_j(y) dy \right| dx \\
 &\leq \int \int |(f(x-y) - f(x))| \cdot |K_j(y)| dy dx \\
 &\stackrel{FT}{=} \int \int |(f(x-y) - f(x))| \cdot |K_j(y)| d\mathbf{x} d\mathbf{y} \\
 &= \int |K_j(y)| \left(\int |(f(x-y) - f(x))| dx \right) dy \\
 &= \int |K_j(y)| \cdot \|f - \tau_y f\|_1 dy.
 \end{aligned}$$

We now split the integral up into pieces.

1. Chose δ small enough such that $|y| < \delta \implies \|f - \tau_y f\|_1 < \varepsilon$ by continuity of translation in L^1 , and
2. Since φ is compactly supported, choose J large enough such that

$$j > J \implies \int_{|y| \geq \delta} |K_j(y)| dy = \int_{|y| \geq \delta} |j\varphi(jy)| dy = 0$$

Then

$$\begin{aligned}
 \|f * K_j - f\|_1 &\leq \int |K_j(y)| \cdot \|f - \tau_y f\|_1 dy \\
 &= \int_{|y| < \delta} |K_j(y)| \cdot \|f - \tau_y f\|_1 dy + \int_{|y| \geq \delta} |K_j(y)| \cdot \|f - \tau_y f\|_1 dy \\
 &= \varepsilon \int_{|y| \geq \delta} |K_j(y)| dy + 0 \\
 &\leq \varepsilon(1) \longrightarrow 0.
 \end{aligned}$$

6.6 6

Should be supremum maybe..?

Let $\{f_k\}$ be a Cauchy sequence, so $\|f_k\| < \infty$ for all k . Then for a fixed x , the sequence $f_k(x)$ is Cauchy in \mathbb{R} and thus converges to some $f(x)$, so define f by $f(x) := \lim_{k \rightarrow \infty} f_k(x)$.

Then $\|f_k - f\| = \max_{x \in X} |f_k(x) - f(x)| \xrightarrow{k \rightarrow \infty} 0$, and thus $f_k \rightarrow f$ uniformly and thus f is continuous. It just remains to show that f has bounded norm.

Choose N large enough so that $\|f - f_N\| < \varepsilon$, and write $\|f_N\| := M < \infty$

$$\|f\| \leq \|f - f_N\| + \|f_N\| < \varepsilon + M < \infty.$$

7.1 1

A is nowhere dense \iff every interval I contains a subinterval $S \subseteq A^c$.

K is compact:

It suffices to show that $K^c := [0, 1] \setminus K$ is open; then K will be a closed and bounded subset of \mathbb{R} and thus compact by Heine-Borel.

We can identify K^c as the set of real numbers in $[0, 1]$ whose decimal expansion **does** use a 4. Let $x \in K^c$, and suppose a 4 occurs as the k th digit and write

$$x = 0.d_1d_2 \cdots d_{k-1} 4 d_{k+1} \cdots = \sum_{j=1}^k d_j 10^{-j} + 4 \cdot 10^{-k} + \sum_{j=k+1}^{\infty} d_j 10^{-j}.$$

Then if we set $r < 10^{-k}$ and pick any $y \in [0, 1]$ such that $y \in B_r(x)$, then $|x - y| < 10^{-k}$. If we write $y = \sum_{j=1}^{\infty} c_j 10^{-j}$, this means that for all $j \leq k$ we have $d_j = c_j$, and in particular $d_k = 4 = c_k$, so y has a 4 in its decimal expansion.

But then $K^c = \bigcup_x B_r(x)$ is a union of open sets and thus open.

K is nowhere dense and $m(K) = 0$:

Since K is closed, we'll show that K can not properly contain any interval, so $(\overline{K})^\circ = \emptyset$.

As in the construction of the Cantor set, let

- K_1 denote $[0, 1]$ with 1 interval $[0.4, 0.5]$ of length $\frac{1}{10}$ deleted
- K_2 denote K_1 with 9 intervals $[0.04, 0.05], [0.14, 0.15], \dots [0.94, 0.95]$ length $\frac{1}{100}$ deleted
- K_n denote K_{n-1} with 9^{n-1} such intervals of length 10^{-n} deleted.

Then $K = \bigcap K_n$, and

$$m(K) = 1 - m(K^c) = 1 - \sum_{j=0}^{\infty} \frac{9^j}{10^{j+1}} = 1 - \frac{1}{10} \left(\frac{1}{1 - \frac{9}{10}} \right) = 0,$$

and since any interval has strictly positive measure, K can not contain any interval.

K has no isolated points:

A point $x \in K$ is isolated iff there is an open ball $B_r(x)$ containing x such that $B_r(x) \cap K = \{x\}$, so every point in this ball has a 4 in its decimal expansion.

Note that $m(K_n) = \left(\frac{9}{10}\right)^n \rightarrow 0$ and that the endpoints of intervals are never removed and are thus elements of K . Then for every ε , we can choose n such that $\left(\frac{9}{10}\right)^n < \varepsilon$; then there is an endpoint of a removed interval e_n satisfying $|x - e_n| \leq \left(\frac{9}{10}\right)^n < \varepsilon$.

So every ball containing x contains some endpoint of a removed interval, and thus an element of K . ■

7.2 2

$$\lambda \ll \mu \iff E \in \mathcal{M}, \mu(E) = 0 \implies \lambda(E) = 0.$$

7.2.1 a

By Radon-Nikodym, if $\lambda \ll \mu$ then $d\lambda = f d\mu$, which would yield

$$\int g d\lambda = \int gf d\mu.$$

So let E be measurable and suppose $\mu(E) = 0$. Then

$$\lambda(E) := \int_E f d\mu = \lim_n \left\{ \varphi_n := \sum_j c_j \mu(E_j) \right\},$$

where we take a sequence of simple functions increasing to f .

But since each $E_j \subseteq E$, we must have $\mu(E_j) = 0$ for any such E_j , so every such φ_n must be zero and thus $\lambda(E) = 0$.

7.2.2 b

By Radon-Nikodym, there exists a positive f such that

$$\int g dm = \int gf d\mu,$$

where we can take $g(x) = x^2$, then the LHS is zero by assumption and thus so is the RHS.

Note that gf is positive.

Define $A_k = \left\{ x \in X \mid gf\chi_E > \frac{1}{k} \right\}$, then by Chebyshev

$$\mu(A_k) \leq k \int_E gf d\mu = 0,$$

which holds for every k .

Then noting that $A_k \searrow A := \{x \in E \mid x^2 > 0\}$, and gf is positive, we have

$$x \in E \iff gf\chi_E(x) > 0 \iff x \in A,$$

so $E = A$ and $\mu(E) = \mu(A)$.

But since $m \ll \mu$ by construction, we can conclude that $m(E) = 0$.

■

7.3 3

7.3.1 a

Letting $x_n := \frac{1}{n}$, we have

$$\sum_{k=1}^{\infty} |f_k(x)| \geq |f_n(x_n)| = |ae^{-ax} - be^{-bx}| := M.$$

In particular, $\sup_x |f_n(x)| \not\rightarrow 0$, so the terms do not go to zero and the sum can not converge.

7.3.2 b

?

7.4 4

Switching to polar coordinates and integrating over a half-circle contained in I^2 , we have

$$\int_{I^2} f \geq \int_0^\pi \int_0^1 \frac{\cos(\theta) \sin(\theta)}{r^2} dr d\theta = \infty,$$

so f is not integrable.

7.5 5

See <https://math.stackexchange.com/questions/507263/prove-that-c1a-b-with-the-c1-norm-is-a-banach-space>

This is clearly a norm, which we'll write $\|\cdot\|_u$

Let f_n be a Cauchy sequence and define a candidate limit $f(x) = \lim_n f_n(x)$.

Then noting that $\|f_n\|_\infty, \|f'_n\|_\infty \leq \|f_n\|_u < \infty$, both f_n, f'_n are Cauchy sequences in $C^0([a, b], \|\cdot\|_\infty)$, which is a Banach space.

So $f_n \rightarrow f$ uniformly, and $f'_n \rightarrow g$ uniformly for some g , and moreover $f, g \in C^0([a, b])$.

We thus have

$$\begin{aligned} f_n(x) - f_n(a) &\xrightarrow{u} f(x) - f(a) \\ \int_a^x f'_n &\xrightarrow{u} \int_a^x g, \end{aligned}$$

and by the FTC, the left-hand sides are equal, and by uniqueness of limits so are the right-hand sides, so $f' = g$.

Since $f, f' \in C^0([a, b])$, they are bounded, and so $\|f\|_u < \infty$. This means that $\|f_n - f\|_u \rightarrow 0$, so f_n converges to f , which is in the same space.
