1 Practice Exam 2 (November 2014)

1.1 1: Fubini-Tonelli

1.1.1 a

Carefully state Tonelli's theorem for a nonnegative function F(x,t) on $\mathbb{R}^n \times \mathbb{R}$.

1.1.2 b

Let $f: \mathbb{R}^n \longrightarrow [0, \infty]$ and define

$$\mathcal{A} := \left\{ (x, t) \in \mathbb{R}^n \times \mathbb{R} \mid 0 \le t \le f(x) \right\}.$$

Prove the validity of the following two statements:

- 1. f is Lebesgue measurable on $\mathbb{R}^n \iff \mathcal{A}$ is a Lebesgue measurable subset of \mathbb{R}^{n+1} .
- 2. If f is Lebesgue measurable on \mathbb{R}^n then

$$m(\mathcal{A}) = \int_{\mathbb{R}^n} f(x) dx = \int_0^\infty m\left(\left\{x \in \mathbb{R}^n \mid f(x) \ge t\right\}\right) dt.$$

1.2 2: Convolutions and the Fourier Transform

1.2.1 a

Let $f, g \in L^1(\mathbb{R}^n)$ and give a definition of f * g.

1.2.2 b

Prove that if f, g are integrable and bounded, then

$$(f*g)(x) \stackrel{|x| \longrightarrow \infty}{\longrightarrow} 0.$$

1.2.3 c

- 1. Define the Fourier transform of an integrable function f on \mathbb{R}^n .
- 2. Give an outline of the proof of the Fourier inversion formula.
- 3. Give an example of a function $f \in L^1(\mathbb{R}^n)$ such that \widehat{f} is not in $L^1(\mathbb{R}^n)$.

1.3 3: Hilbert Spaces

Let $\{u_n\}_{n=1}^{\infty}$ be an orthonormal sequence in a Hilbert space H.

1.3.1 a

Let $x \in H$ and verify that

$$\left\| x - \sum_{n=1}^{N} \langle x, u_n \rangle u_n \right\|_{H}^{2} = \|x\|_{H}^{2} - \sum_{n=1}^{N} |\langle x, u_n \rangle|^{2}.$$

for any $N \in \mathbb{N}$ and deduce that

$$\sum_{n=1}^{\infty} |\langle x, u_n \rangle|^2 \le ||x||_H^2.$$

1.3.2 b

Let $\{a_n\}_{n\in\mathbb{N}}\in\ell^2(\mathbb{N})$ and prove that there exists an $x\in H$ such that $a_n=\langle x, u_n\rangle$ for all $n\in\mathbb{N}$, and moreover x may be chosen such that

$$||x||_H = \left(\sum_{n \in \mathbb{N}} |a_n|^2\right)^{\frac{1}{2}}.$$

Proof.

- Take $\{a_n\} \in \ell^2$, then note that $\sum |a_n|^2 < \infty \implies$ the tails vanish.
- Define $x := \lim_{N \to \infty} S_N$ where $S_N = \sum_{k=1}^N a_k u_k$
- $\{S_N\}$ is Cauchy and H is complete, so $x \in H$.
- By construction,

$$\langle x, u_n \rangle = \left\langle \sum_k a_k u_k, u_n \right\rangle = \sum_k a_k \langle u_k, u_n \rangle = a_n$$

since the u_k are all orthogonal.

• By Pythagoras since the u_k are normal,

$$||x||^2 = \left\| \sum_k a_k u_k \right\|^2 = \sum_k ||a_k u_k||^2 = \sum_k |a_k|^2.$$

1.3.3 c

Prove that if $\{u_n\}$ is *complete*, Bessel's inequality becomes an equality.

Proof.

Let x and u_n be arbitrary.

$$\left\langle x - \sum_{k=1}^{\infty} \langle x, u_k \rangle u_k, u_n \right\rangle = \langle x, u_n \rangle - \left\langle \sum_{k=1}^{\infty} \langle x, u_k \rangle u_k, u_n \right\rangle$$

$$= \langle x, u_n \rangle - \sum_{k=1}^{\infty} \langle \langle x, u_k \rangle u_k, u_n \rangle$$

$$= \langle x, u_n \rangle - \sum_{k=1}^{\infty} \langle x, u_k \rangle \langle u_k, u_n \rangle$$

$$= \langle x, u_n \rangle - \langle x, u_n \rangle = 0$$

$$\implies x - \sum_{k=1}^{\infty} \langle x, u_k \rangle u_k = 0 \quad \text{by completeness.}$$

So

$$x = \sum_{k=1}^{\infty} \langle x, u_k \rangle u_k \implies ||x||^2 = \sum_{k=1}^{\infty} |\langle x, u_k \rangle|^2. \blacksquare.$$

1.4 4: Lp Spaces

1.4.1 a

?

1.4.2 b

Prove Minkowski's Inequality:

$$1 \le p < \infty \implies ||f + g||_n \le ||f||_n + ||g||_n$$

Conclude that if $f, g \in L^p(\mathbb{R}^n)$ then so is f + g.

1.4.3 c

Let $X = [0, 1] \subset \mathbb{R}$.

- 1. Give a definition of the Banach space $L^{\infty}(X)$ of essentially bounded functions of X.
- 2. Let f be non-negative and measurable on X, prove that

$$\int_X f(x)^p dx \stackrel{p \longrightarrow \infty}{\longrightarrow} \begin{cases} \infty & \text{or} \\ m(\{f^{-1}(1)\}) \end{cases},$$

and characterize the functions of each type

Proof:

$$\begin{split} \int f^p &= \int_{x \le 1} f^p + \int_{x=1} f^p + \int_{x \ge 1} f^p \\ &= \int_{x \le 1} f^p + \int_{x=1} 1 + \int_{x \ge 1} f^p \\ &= \int_{x \le 1} f^p + m(\{f=1\}) + \int_{x \ge 1} f^p \\ &\stackrel{p \longrightarrow \infty}{\longrightarrow} 0 + m(\{f=1\}) + \begin{cases} 0 & m(\{x \ge 1\}) = 0 \\ \infty & m(\{x \ge 1\}) > 0. \end{cases} \end{split}$$

1.5 5: Dual Spaces

Let X be a normed vector space.

1.5.1 a

Give the definition of what it means for a map $L: X \longrightarrow \mathbb{C}$ to be a linear functional.

1.5.2 b

Define what it means for L to be bounded and show L is bounded \iff L is continuous.

1.5.3 c

Prove that $(X^{\vee}, \|\cdot\|_{\text{op}})$ is a Banach space.

Bessel's Inequality: For any orthonormal set in a Hilbert space (not necessarily a basis), we have

$$\sum_{n=1}^{\infty} |\langle x, u_n \rangle|^2 \le ||x||^2$$

Proof:

$$0 \le \left\| x - \sum_{k=1}^{n} \left\langle x, e_k \right\rangle e_k \right\|^2$$

Corollary (Parseval's Identity): If span $\{u_n\}$ is dense in \mathcal{H} , so it is a basis, then this is an equality.

Riesz-Fischer: Let $U = \{u_n\}_{n=1}^{\infty}$ be an orthonormal set (not necessarily a basis), then

1. There is an isometric surjection

$$\mathcal{H} \longrightarrow \ell^2(\mathbb{N})$$

 $\mathbf{x} \mapsto \{\langle \mathbf{x}, \mathbf{u}_n \rangle\}_{n=1}^{\infty}$

i.e. if $\{a_n\} \in \ell^2(\mathbb{N})$, so $\sum |a_n|^2 < \infty$, then there exists a $\mathbf{x} \in \mathcal{H}$ such that

$$a_n = \langle \mathbf{x}, \ \mathbf{u}_n \rangle \quad \forall n.$$

2. \mathbf{x} can be chosen such that

$$\|\mathbf{x}\|^2 = \sum |a_n|^2$$

Note: the choice of **x** is unique \iff $\{u_n\}$ is **complete**, i.e. $\langle \mathbf{x}, \mathbf{u}_n \rangle = 0$ for all n implies

Proof:

- Given {a_n}, define S_N = ∑^N a_n**u**_n.
 S_N is Cauchy in H and so S_N → **x** for some **x** ∈ H.
 ⟨x, u_n⟩ = ⟨x S_N, u_n⟩ + ⟨S_N, u_n⟩ → a_n

- By construction, $||x S_N||^2 = ||x||^2 \sum_{n=1}^{N} |a_n|^2 \longrightarrow 0$, so $||x||^2 = \sum_{n=1}^{\infty} |a_n|^2$.

2.5 5

See Problem Set 5.

Heine-Cantor theorem: Every continuous function on a compact set is uniformly continuous. Uniform continuity:

$$\forall \varepsilon \quad \exists \delta(\varepsilon) \mid \quad \forall x, y, \quad |x - y| < \delta \implies |f(x) - f(y)| < \varepsilon$$

$$\iff \forall \varepsilon \quad \exists \delta(\varepsilon) \mid \quad \forall x, y, \quad |y| < \delta \implies |f(x - y) - f(y)| < \varepsilon$$

Fubini-Tonelli interchange of integrals, where the change of bounds becomes very important. Continuity in L^1 :

$$\lim_{y \longrightarrow 0} \left\| \tau_y f - f \right\|_1 = 0.$$
