## 1 Spring 2017

## 1.1 1

Concepts used:

- Definition: A is nowhere dense  $\iff$  every interval I contains a subinterval  $S \subseteq A^c$ .
  - Equivalently, the interior of the closure is empty,  $(\overline{K})^{\circ} = \emptyset$ .

## Solution

Claim: K is compact.

- It suffices to show that  $K^c := [0,1] \setminus K$  is open; Then K will be a closed and bounded subset of  $\mathbb{R}$  and thus compact by Heine-Borel.
- Strategy: write  $K^c$  as the union of open balls (since these form a basis for the Euclidean topology on  $\mathbb{R}$ ).
  - Do this by showing every point  $x \in K^c$  is an interior point, i.e. x admits a neighborhood  $N_x$  such that  $N_x \subseteq K^c$ .
- Identify  $K^c$  as the set of real numbers in [0,1] whose decimal expansion **does** contain a 4.
  - We will show that there exists a neighborhood small enough such that all points in it contain a 4 in their decimal expansions.

• Let  $x \in K^c$ , suppose a 4 occurs as the kth digit, and write

$$x = 0.d_1 d_2 \cdots d_{k-1} \ 4 \ d_{k+1} \cdots = \left( \sum_{j=1}^k d_j 10^{-j} \right) + \left( 4 \cdot 10^{-k} \right) + \left( \sum_{j=k+1}^\infty d_j 10^{-j} \right).$$

• Set  $r_x < 10^{-k}$  and let  $y \in [0,1] \cap B_{r_x}(x)$  be arbitrary and write

$$y = \sum_{i=1}^{\infty} c_i 10^{-i}.$$

- Thus  $|x y| < r_x < 10^{-k}$ , and the first k digits of x and y must agree:
  - We first compute the difference:

$$x - y = \sum_{i=1}^{\infty} d_i 10^{-i} - \sum_{i=1}^{\infty} c_i 10^{-i} = \sum_{i=1}^{\infty} (d_i - c_i) 10^{-i}$$

- Thus (claim)

$$|x - y| \le \sum_{j=1}^{\infty} |d_j - c_j| 10^j < 10^{-k} \iff |d_j - c_j| = 0 \quad \forall j \le k.$$

- Otherwise we can note that any term  $|d_j - c_j| \ge 1$  and there is a contribution to |x - y| of at least  $1 \cdot 10^{-j}$  for some j < k, whereas

$$j < k \iff 10^{-j} > 10^{-k}$$

a contradiction.

- This means that for all  $j \leq k$  we have  $d_j = c_j$ , and in particular  $d_k = 4 = c_k$ , so y has a 4 in its decimal expansion.
- But then  $K^c = \bigcup_x B_{r_x}(x)$  is a union of open sets and thus open.

Claim: K is nowhere dense and m(K) = 0:

- Strategy: Show  $(\overline{K})^{\circ} = \emptyset$ .
- Since K is closed,  $\overline{K} = K$ , so it suffices to show that K does not properly contain any interval.
- It suffices to show  $m(K^c) = 1$ , since this implies m(K) = 0 and since any interval has strictly positive measure, this will mean K can not contain an interval.
- As in the construction of the Cantor set, let
  - $K_0$  denote [0,1] with 1 interval  $\left(\frac{4}{10},\frac{5}{10}\right)$  of length  $\frac{1}{10}$  deleted, so

$$m(K_0^c) = \frac{1}{10}.$$

-  $K_1$  denote  $K_0$  with 9 intervals  $\left(\frac{1}{100}, \frac{5}{100}\right)$ ,  $\left(\frac{14}{100}, \frac{15}{100}\right)$ ,  $\cdots \left(\frac{94}{100}, \frac{95}{100}\right)$  of length  $\frac{1}{100}$  deleted, so

$$m(K_1^c) = \frac{1}{10} + \frac{9}{100}.$$

-  $K_n$  denote  $K_{n-1}$  with  $9^n$  such intervals of length  $\frac{1}{10^{n+1}}$  deleted, so

$$m(K_n^c) = \frac{1}{10} + \frac{9}{100} + \dots + \frac{9^n}{10^{n+1}}.$$

• Then compute

$$m(K^c) = \sum_{i=0}^{\infty} \frac{9^n}{10^{n+1}} = \frac{1}{10} \sum_{i=0}^{\infty} \left(\frac{9}{10}\right)^n = \frac{1}{10} \left(\frac{1}{1 - \frac{9}{10}}\right) = 1.$$

Claim: K has no isolated points:

- A point  $x \in K$  is isolated iff there is an open ball  $B_r(x)$  containing x such that  $B_r(x) \subseteq K^c$ .
  - So every point in this ball **should** have a 4 in its decimal expansion.
- Strategy: show that if  $x \in K$ , every neighborhood of x intersects K.
- Note that  $m(K_n) = \left(\frac{9}{10}\right)^n \stackrel{n \to \infty}{\longrightarrow} 0$
- Also note that we deleted open intervals, and the endpoints of these intervals are never deleted.
  - Thus endpoints of deleted intervals are elements of K.
- Fix x. Then for every  $\varepsilon$ , by the Archimedean property of  $\mathbb{R}$ , choose n such that  $\left(\frac{9}{10}\right)^n < \varepsilon$ .
- Then there is an endpoint  $x_n$  of some deleted interval  $I_n$  satisfying

$$|x - x_n| \le \left(\frac{9}{10}\right)^n < \varepsilon.$$

• So every ball containing x contains some endpoint of a removed interval, and thus an element of K.

#### 1.2 2

Concepts used:

- Absolute continuity of measures:  $\lambda \ll \mu \iff E \in \mathcal{M}, \mu(E) = 0 \implies \lambda(E) = 0.$
- Radon-Nikodym: if  $\lambda \ll \mu$ , then there exists a measurable function  $\frac{\partial \lambda}{\partial \mu} := f$  where  $\lambda(E) = \int_E f \, d\mu$ .

#### 1.2.1 a

- Strategy: use approximation by simple functions to show absolute continuity and apply Radon-Nikodym
- Claim:  $\lambda \ll \mu$ , i.e.  $\mu(E) = 0 \implies \lambda(E) = 0$ .
  - Note that if this holds, by Radon-Nikodym,  $f = \frac{\partial \lambda}{\partial \mu} \implies d\lambda = f d\mu$ , which would yield

$$\int g \ d\lambda = \int g f \ d\mu.$$

- So let E be measurable and suppose  $\mu(E) = 0$ .
- Then

$$\lambda(E) \coloneqq \int_{E} f \ d\mu = \lim_{n \to \infty} \left\{ \int_{E} s_n \, d\mu \mid s_n \coloneqq \sum_{j=1}^{\infty} c_j \mu(E_j), \ s_n \nearrow f \right\}$$

where we take a sequence of simple functions increasing to f.

• But since each  $E_j \subseteq E$ , we must have  $\mu(E_j) = 0$  for any such  $E_j$ , so every such  $s_n$  must be zero and thus  $\lambda(E) = 0$ .

What is the final step in this approximation?

#### 1.2.2 b

- Set  $g(x) = x^2$ , note that g is positive and measurable.
- By part (a), there exists a positive f such that for any  $E \subseteq \mathbb{R}$ ,

$$\int_{E} g \ dm = \int_{E} g f \ d\mu$$

- The LHS is zero by assumption and thus so is the RHS.
- Note that gf is positive.
- Define  $A_k = \left\{ x \in X \mid gf\chi_E > \frac{1}{k} \right\}$ , then by Chebyshev, for every k we have

$$\mu(A_k) \le k \int_E gf \ d\mu = 0$$

• Then noting that  $A_k \searrow A := \{x \in E \mid x^2 > 0\}$ , and gf is positive, we have

$$x \in E \iff q f \chi_E(x) > 0 \iff x \in A$$

so E = A and  $\mu(E) = \mu(A)$ .

• But since  $m \ll \mu$  by construction, we can conclude that m(E) = 0.

#### 1.3 3

#### 1.3.1 a

Letting  $x_n := \frac{1}{n}$ , we have

$$\sum_{k=1}^{\infty} |f_k(x)| \ge |f_n(x_n)| = \left| ae^{-ax} - be^{-bx} \right| := M.$$

In particular,  $\sup_{x} |f_n(x)| \not\longrightarrow 0$ , so the terms do not go to zero and the sum can not converge.

#### 1.3.2 b

?

## 1.4 4

Switching to polar coordinates and integrating over a half-circle contained in  $I^2$ , we have

$$\int_{I^2} f \ge \int_0^{\pi} \int_0^1 \frac{\cos(\theta)\sin(\theta)}{r^2} dr d\theta = \infty,$$

so f is not integrable.

### 1.5 5

See https://math.stackexchange.com/questions/507263/prove-that-c1a-b-with-the-c1-norm-is-a-banach-space

This is clearly a norm, which we'll write  $\|\cdot\|_{u}$ 

Let  $f_n$  be a Cauchy sequence and define a candidate limit  $f(x) = \lim_n f_n(x)$ .

Then noting that  $||f_n||_{\infty}$ ,  $||f'_n||_{\infty} \le ||f_n||_u < \infty$ , both  $f_n$ ,  $f_n$  are Cauchy sequences in  $C^0([a, b], ||\cdot||_{\infty})$ , which is a Banach space.

So  $f_n \longrightarrow f$  uniformly, and  $f'_n \longrightarrow g$  uniformly for some g, and moreover  $f, g \in C^0([a, b])$ .

We thus have

$$f_n(x) - f_n(a) \xrightarrow{u} f(x) - f(a)$$

$$\int_a^x f'_n \xrightarrow{u} \int_a^x g,$$

and by the FTC, the left-hand sides are equal, and by uniqueness of limits so are the right-hand sides, so f' = g.

Since  $f, f' \in C^0([a, b])$ , they are bounded, and so  $||f||_u < \infty$ . This means that  $||f_n - f||_u \longrightarrow 0$ , so  $f_n$  converges to f, which is in the same space.
