### 1 Theorems

Theorem 1.1 (Summation by Parts).

Define the forward difference operator  $\Delta f_k = f_{k+1} - f_k$ , then

$$\sum_{k=m}^{n} f_k \Delta g_k + \sum_{k=m}^{n-1} g_{k+1} \Delta f_k = f_n g_{n+1} - f_m g_m.$$

Note: compare to  $\int_a^b f dg + \int_a^b g df = f(b)g(b) - f(a)g(a)$ .

Theorem 1.2 (Morera's Theorem).

Theorem (Cauchy Integral Formula) Suppose f is holomorphic on  $\Omega$ , then

$$f(z) = \frac{1}{2\pi i} \oint_{\partial \Omega}$$

and

$$\frac{\partial^n f}{\partial z^n}(z) - \frac{n!}{2\pi i} \oint_{\partial \Omega} \frac{f\xi}{(\xi - z)^{n+1}} d\xi.$$

Theorem (Cauchy's Inequality) For  $z_o \in D_R(z_0) \subset \Omega$ , we have

$$\left| f^{(n)}(z_0) \right| \le \frac{n!}{2\pi} \int_0^{2\pi} \frac{\|f\|_{C_R}}{R^{n+1}} R d\theta = \frac{n! \|f\|_{C_R}}{R^n}.$$

**Theorem (Liouville)** If f is entire and bounded, f is constant.

**Theorem (Argument Principle)** ?

**Theorem (Green's)** If  $\Omega \subseteq \mathbb{C}$  is bounded with  $\partial \Omega$  piecewise smooth and  $f, g \in C^1(\overline{\Omega})$ , then

$$\int_{\partial\Omega} f \, dx + g \, dy = \iint_{\Omega} \left( \frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) dA.$$

**Theorem (Rouche)** If f, g are analytic on a domain  $\Omega$  with finitely many zeros in  $\Omega$  and  $\gamma \subset \Omega$  is a closed curve surrounding each point exactly once, where |g| < |f| on  $\gamma$ , then f and f + g have the same number of zeros.

**Example** 

- Take  $P(z) = z^4 + 6z + 3$ .
- On |z| < 2:
  - Set  $f(z) = z^4$  and g(z) = 6z + 3, then  $|g(z)| \le 6|z| + 3 = 15 < 16 = |f(z)|$ .
  - So P has 4 zeros here.

- On |z| < 1:
  - Set f(z) = 6z and  $g(z) = z^4 + 3$ .
  - Check  $|g(z)| \le |z|^4 + 3 = 4 < 6 = |f(z)|$ .
  - So P has 1 zero here.

### **Example**

- Claim: the equation  $\alpha z e^z = 1$  where  $|\alpha| > e$  has exactly one solution in  $\mathbb{D}$ .
- Set  $f(z) = \alpha z$  and  $g(z) = e^{-z}$ .
- Estimate at |z|=1 we have  $|g|=\left|e^{-z}\right|=e^{-\Re(z)}\leq e^1<|\alpha|=|f(z)|$
- f has one zero at  $z_0 = 0$ , thus so does f + g.

**Theorem (Open Mapping)** Any holomorphic non-constant map is an open map.

**Theorem (Maximum Modulus)** If f is holomorphic and nonconstant on an open region  $\Omega$ , then |f| can not attain a maximum on  $\Omega$ . If  $\Omega$  is bounded and f is continuous on  $\overline{\Omega}$ , then  $\max_{\overline{\Omega}} |f|$  occurs on  $\partial\Omega$ .

Conversely, if f attains a local maximum at  $z_0 \in \Omega$ , then f is constant on  $\Omega$ .

**Theorem (Casorati-Weierstrass)** If f is holomorphic on  $\Omega \setminus \{z_0\}$  where  $z_0$  is an essential singularity, then for every  $V \subset \Omega \setminus \{z_0\}$ , f(V) is dense in  $\mathbb{C}$ .

**Theorem (Cayley Transform)** The fractional linear transformation given by  $F(z) = \frac{i-z}{i+z}$  maps  $\mathbb{D} \longrightarrow \mathbb{H}$  with inverse  $G(w) = i\frac{1-w}{1+w}$ .

**Theorem (Continuation Principle)** If f is holomorphic on a bounded connected domain  $\Omega$  and there exists a sequence  $\{z_i\}$  with a limit point in  $\Omega$  such that  $f(z_i) = 0$ , then  $f \equiv 0$  on  $\Omega$ .

**Theorem (Schwarz Reflection)** If f is continuous and holomorphic on  $\mathbb{H}^+$  and real-valued on  $\mathbb{R}$ , then the extension defined by  $F(z) = \overline{f(\overline{z})}$  for  $z \in \mathbb{H}^-$  is a well-defined holomorphic function on  $\mathbb{C}$ .

Note:  $\mathbb{H}^+, \mathbb{H}^-$  can be replaced with any region symmetric about a line segment  $L \subseteq \mathbb{R}$ .

**Theorem (Schwarz Lemma)** If  $f: \mathbb{D} \longrightarrow \mathbb{D}$  is holomorphic with f(0) = 0, then

- 1.  $|f(z)| \leq |z|$  for all  $z \in \mathbb{D}$
- 2.  $|f'(0)| \le 1$ .

Moreover, if  $|f(z_0)| = |z_0|$  for any  $z_0 \in \mathbb{D}$  or |f'(0)| = 1, then f is a rotation

**Theorem (Riemann Mapping)** If  $\Omega$  is simply connected, nonempty, and not  $\mathbb{C}$ , then for every  $z_0 \in \Omega$  there exists a unique conformal map  $F: \Omega \longrightarrow \mathbb{D}$  such that  $F(z_0) = 0$  and  $F'(z_0) > 0$ .

Thus any two such sets  $\Omega_1, \Omega_2$  are conformally equivalent.

### 2 Stuff

### 2.0.1 Fundamental Theorem of Algebra: Argument Principle

- Let  $P(z) = a_n z^n + \cdots + a_0$  and g(z) = P'(z)/P(z), note P is holomorphic
- Since  $\lim_{|z| \to \infty} P(z) = \infty$ , there exist an R > 0 such that P has no roots in  $\{|z| \ge R\}$ .

3

• Apply the argument principle:

$$N(0) = \frac{1}{2\pi i} \oint_{|\xi|=R} g(\xi) d\xi.$$

- Check that  $\lim_{|z \longrightarrow \infty|} zg(z) = n$ , so g has a simple pole at  $\infty$
- Then g has a Laurent series  $\frac{n}{z} + \frac{c_2}{z^2} + \cdots$
- Integrate term-by-term to get N(0) = n.

### 2.0.2 Fundamental Theorem of Algebra: Rouche's Theorem

- Let  $P(z) = a_n z^n + \cdots + a_0$
- Set  $f(z) = a_n z^n$  and  $g(z) = P(z) f(z) = a_{n-1} z^{n-1} + \dots + a_0$ , so f + g = P. Choose  $R > \max\left(\frac{|a_{n-1}| + \dots + |a_0|}{|a_n|}, 1\right)$ , then

$$\begin{split} |g(z)| &\coloneqq |a_{n-1}z^{n-1} + \dots + a_1z + a_0| \\ &\le |a_{n-1}z^{n-1}| + \dots + |a_1z| + |a_0| \quad \text{by the triangle inequality} \\ &= |a_{n-1}| \cdot |z^{n-1}| + \dots + |a_1| \cdot |z| + |a_0| \\ &= |a_{n-1}| \cdot R^{n-1} + \dots + |a_1|R + |a_0| \\ &\le |a_{n-1}| \cdot R^{n-1} + |a_{n-2}| \cdot R^{n-1} + \dots + |a_1| \cdot R^{n-1} + |a_0| \cdot R^{n-1} \quad \text{since } R > 1 \implies R^{a+b} \ge R^a \\ &= R^{n-1} \left( |a_{n-1}| + |a_{n-2}| + \dots + |a_1| + |a_0| \right) \\ &\le R^{n-1} \left( |a_n| \cdot R \right) \quad \text{by choice of } R \\ &= R^n |a_n| \\ &= |a_n z^n| \\ &\coloneqq |f(z)| \end{split}$$

• Then  $a_n z^n$  has n zeros in |z| < R, so f + g also has n zeros.

### 2.0.3 Fundamental Theorem of Algebra: Liouville's Theorem

- Suppose p is nonconstant and has no roots, then  $\frac{1}{n}$  is entire
- Write  $g(z) := \frac{p(z)}{z^n} = a_n \left( \frac{a_{n-1}}{z} + \dots + \frac{a_0}{z^n} \right)$
- Outside a disc:
  - Note  $\lim_{z \to \infty} = 0$  for the parenthesized terms, so there exists an R large enough such that  $|g(z)| \ge \frac{1}{2}|a_n|$
  - Then  $|p(z)| \ge \frac{R^n}{2} |a_n|$  implies  $\frac{1}{n}$  is bounded in |z| > R
- Inside a disc:
  - p is continuous with no roots so p is bounded below on |z| < R.
  - -p is continuous on a compact set and thus achieves a min A
  - Set  $B = \min(A, \frac{R^n}{2} |a_n|)$ , then  $p \ge B$  on |z| < R.

- Thus p is bounded below everywhere and thus  $\frac{1}{p}$  is bounded above everywhere, thus bounded.
- Thus  $\frac{1}{p}$  is constant, forcing p to be constant.

### 2.0.4 Fundamental Theorem of Algebra: Open Mapping Theorem

- p induces a continuous map  $\mathbb{CP}^1 \longrightarrow \mathbb{CP}^1$
- The continuous image of compact space is compact;
- Since the codomain is Hausdorff space, the image is closed.
- p is holomorphic and non-constant, so by the Open Mapping Theorem, the image is open.
- Thus the image is clopen in  $\mathbb{CP}^1$ .
- The image is nonempty, since  $p(1) = \sum a_i \in \mathbb{C}$
- $\mathbb{CP}^1$  is connected
- But the only nonempty clopen subset of a connected space is the entire space.
- So p is surjective, and  $p^{-1}(0)$  is nonempty.
- So p has a root.

### 3 Conformal Maps

Conformal maps  $\mathbb{D} \longrightarrow \mathbb{D}$  have the form

$$g(z) = \lambda \frac{1-a}{1-\bar{a}z}, \quad |a| < 1, \quad |\lambda| = 1.$$

#### 3.1 Plane to Disc

$$\begin{split} \varphi: \mathbb{H} &\longrightarrow \mathbb{D} \\ \varphi(z) &= \frac{z-i}{z+i} \qquad f^{-1}(z) = i \bigg( \frac{1+w}{1-w} \bigg). \end{split}$$

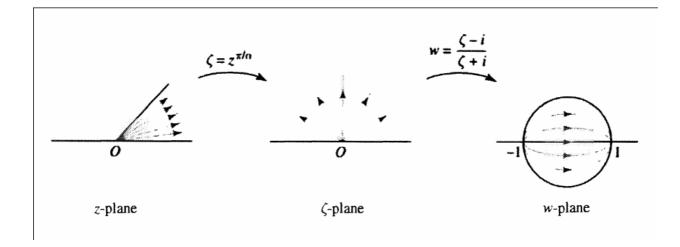

#### 3.2 Sector to Disc

For  $S_{\alpha} := \{z \in \mathbb{C} \mid 0 < \arg(z) < \alpha\}$  an open sector for  $\alpha$  some angle, first map the sector to the half-plane:

$$g: S_{\alpha} \longrightarrow \mathbb{H}$$
$$g(z) = z^{\frac{\pi}{\alpha}}.$$

Then compose with a map  $\mathbb{H} \longrightarrow \mathbb{D}$ :

$$f: S_{\alpha} \longrightarrow \mathbb{D}$$
 
$$f(z) = (\varphi \circ g)(z) = \frac{z^{\frac{\pi}{\alpha}} - i}{z^{\frac{\pi}{\alpha}} + i}.$$

### 3.3 Strip to Disc

- Map to horizontal strip by rotation  $z \mapsto \lambda z$ .
- Map horizontal strip to sector by  $z \mapsto e^z$
- Map sector to  $\mathbb{H}$  by  $z \mapsto z^{\frac{\pi}{\alpha}}$ .
- Map  $\mathbb{H} \longrightarrow \mathbb{D}$ .

### 4 Appendix

$$dz = dx + i \ dy$$

$$d\bar{z} = dx - i \ dy$$

$$f_z = f_x = i^{-1} f_y$$

$$\int_0^{2\pi} e^{i\ell x} dx = \begin{cases} 2\pi & (\ell = 0) \\ 0 & (\ell \neq 0) \end{cases}.$$

- Holomorphic: once complex differentiable in neighborhoods of every point.
- Analytic: equal to its Taylor series expansion

Collection of facts used on problem sets

### 4.1 Things to know well:

- Cauchy Integral Formula
- Estimates for derivatives, mean value theorem
- Rouché's theorem
- Casorati-Weierstrass
- The 8 types of conformal maps

#### 4.2 Theorems

### 4.2.1 The Argument Principle

**Theorem (Statement 1)** For f meromorphic in  $\gamma^{\circ}$ ,

$$\Delta_{\gamma} \arg f(z) = 2\pi (Z_f - P_f).$$

#### 4.2.2 Rouche

**Theorem (Statement 1)** Suppose f = g + h with  $g \neq 0, \infty$  on  $\gamma$  with |g| > |h| on  $\gamma$ . Then

$$\Delta_{\gamma} \arg(f) = \Delta_{\gamma} \arg(h)$$
 and  $Z_f - P_f = Z_g - P_g$ .

### 4.3 Misc Prereq

Standard forms of conic sections:

- Circle:  $x^2 + y^2 = r^2$  Ellipse:  $\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1$
- Hyperbola:  $\left(\frac{x}{a}\right)^2 \left(\frac{y}{b}\right)^2 = 1$ 
  - Rectangular Hyperbola:  $xy = \frac{c^2}{2}$ .
- Parabola:  $-4ax + y^2 = 0$

Mnemonic: Write  $f(x,y) = Ax^2 + Bxy + Cy^2 + \cdots$ , then consider the discriminant  $\Delta =$  $B^2 - 4AC$ :

- $\Delta < 0 \iff \text{ellipse}$ 
  - $-\Delta < 0$  and  $A = C, B = 0 \iff$  circle
- $\Delta = 0 \iff \text{parabola}$
- $\Delta > 0 \iff \text{hyperbola}$

#### Completing the square:

$$x^{2} - bx = (x - s)^{2} - s^{2}$$
 where  $s = \frac{b}{2}$   
 $x^{2} + bx = (x + s)^{2} - s^{2}$  where  $s = \frac{b}{2}$ .

### **Useful Properties**

- $\Re(z) = \frac{1}{2}(z + \bar{z})$  and  $\Im(z) = \frac{1}{2i}(z \bar{z})$ .  $z\bar{z} = |z|^2$   $\cos(\theta) = \frac{1}{2}(e^{i\theta} + e^{-i\theta})$   $\sin(\theta) = \frac{1}{2i}(e^{i\theta} e^{-i\theta})$ .

#### **Useful Series**

$$\sum_{k=1}^{n} k = \frac{n(n+1)}{2}$$

$$\sum_{k=1}^{n} k^2 = \frac{n(n+1)(2n+1)}{6}$$

$$\sum_{k=1}^{n} k^3 = \frac{n^2(n+1)^2}{4}$$

$$\log(z) = \sum_{j=0}^{\infty} (-1)^j \frac{(z-a)^j}{j}$$

#### Cauchy-Riemann Equations

$$u_x = v_y$$
 and  $u_y = -v_x$   
 $\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}$  and  $\frac{\partial v}{\partial r} = -\frac{1}{r} \frac{\partial u}{\partial \theta}$ 

### 4.4 Useful Techniques

Showing a function is constant:

- Write f = u + iv and use Cauchy-Riemann to show  $u_x, u_y = 0$ , etc.
- Show that f is entire and bounded.

Showing a function is zero: Show f is entire, bounded, and  $\lim_{z \to \infty} f(z) = 0$ .

**Deriving Polar Cauchy-Riemann:** See walkthrough here. Take derivative along two paths, along a ray with constant angle  $\theta_0$  and along a circular arc of constant radius  $r_0$ . Then equate real and imaginary parts. See problem set 1.

Computing Arguments: Arg(z/w) = Arg(z) - Arg(w).

The sum of the interior angles of an *n*-gon is  $(n-2)\pi$ , where each angle is  $\frac{n-2}{n}\pi$ .

#### 4.5 Residues

If p is a simple pole,  $\operatorname{Res}(p,f) = \lim_{z \to p} (z-p) f(z)$ . Example: Let  $f(z) = \frac{1}{1+z^2}$ , then  $\operatorname{Res}(i,f) = \frac{1}{2i}$ .

Green's Theorem: Todo

$$\frac{\partial}{\partial z} \sum_{j=0}^{\infty} a_j z^j = \sum_{j=0}^{\infty} a_{j+1} z^j.$$

### 4.6 Pithy Statements

- Little Picard: f misses at most one point and is a homeomorphism onto its image.
- Baire's Theorem: The intersection of open dense sets is open.
- Casorati-Weierstrass: The image of a disc punctured at an essential singularity is dense in C.
- Open Mapping: Holomorphic functions preserve open sets.
- Argument Principle: The logarithmic derivative measures the difference of zeros and poles.
- Liouville: Bounded entire functions are constant.
- Maximum Modulus: Holomorphic functions take extrema only on boundaries.
- Cauchy Inequalities: The *n*th Taylor coefficient is at most  $\sup_{|z|=R} |f|/R^n$ .
- Cauchy's Theorem: Integrals of holomorphic functions vanish.
- Morera: Integrals vanishing along every rectangle implies holomorphic.
- Schwarz Reflection: ???
- Identity Theorem: Two functions agreeing on a set with a limit point are equal on a domain.
- The ring of holomorphic functions on a domain in  $\mathbb{C}$  has no zero divisors (by the identity principle).

### 4.7 Precise Refinements

Cauchy Inequality: Given  $z_0 \in \Omega$ , pick the largest disc  $D_R(z_0) \subset \Omega$  and let  $C_R = \partial D_R$ . Using the integral formula, defining  $||f||_{C_R} = \max_{|z-z_0|=R} |f(z)|$ 

$$\left| f^{(n)}(z_0) \right| \le \frac{n!}{2\pi} \int_0^{2\pi} \frac{\|f\|_{C_R}}{R^{n+1}} R \ d\theta = \frac{n! \|f\|_{C_R}}{R^n}.$$

Basics

- Show that  $\frac{1}{z}\sum_{k=1}^{\infty}\frac{z^k}{k}$  converges on  $S^1\setminus\{1\}$  using summation by parts.
- Show that any power series is continuous on its domain of convergence.
- Show that a uniform limit of continuous functions is continuous.

??

- Show that if f is holomorphic on  $\mathbb D$  then f has a power series expansion that converges uniformly on every compact  $K \subset \mathbb D$ .
- Show that any holomorphic function f can be uniformly approximated by polynomials.
- Show that if f is holomorphic on a connected region  $\Omega$  and  $f' \equiv 0$  on  $\Omega$ , then f is constant on  $\Omega$ .
- Show that if |f| = 0 on  $\partial \Omega$  then either f is constant or f has a zero in  $\Omega$ .
- Show that if  $\{f_n\}$  is a sequence of holomorphic functions converging uniformly to a function f on every compact subset of  $\Omega$ , then f is holomorphic on  $\Omega$  and  $\{f'_n\}$  converges uniformly to f' on every such compact subset.
- Show that if each  $f_n$  is holomorphic on  $\Omega$  and  $F := \sum f_n$  converges uniformly on every compact subset of  $\Omega$ , then F is holomorphic.

Show that if $f$ is once complex differentiable at each point of $\Omega$ , then $f$ is holomorphic.
