Contents

1 Definitions

- Closed (several characterizations)

- Closure in a subspace: $Y \subset X \implies \mathrm{cl}_Y(A) := \mathrm{cl}_X(A) \bigcap Y$.

- Bounded

- Compact

- Locally compact

- Connected: There does not exist a disconnecting set $X = A \coprod B$ such that $\emptyset \neq A, B \subsetneq$, i.e. X is the union of two proper disjoint nonempty sets. Equivalently, X contains no proper nonempty clopen sets.

  - Additional condition for a subspace $Y \subset X$: $\mathrm{cl}_Y(A) \bigcap V = A \bigcap \mathrm{cl}_Y(B) = \emptyset$.

- Locally connected: A space is locally connected at a point x iff $\forall N_x \ni x$, there exists a $U \subset N_x$ containing x that is connected.

- Retract: A subspace $A \subset X$ is a *retract* of X iff there exists a continuous map $f : X \longrightarrow A$ such that $f\big|_A = \mathrm{id}_A$. Equivalently it is a *left* inverse to the inclusion.

- Uniform Continuity: For $f : (X, d_x) \longrightarrow (Y, d_Y)$ metric spaces,
$$\forall \varepsilon > 0, \ \exists \delta > 0 \text{ such that} \quad d_X(x_1, x_2) < \delta \implies d_Y(f(x_1), f(x_2)) < \varepsilon.$$

- Lebesgue number: For (X, d) a compact metric space and $\{U_\alpha\} \rightrightarrows X$, there exist $\delta_L > 0$ such that
$$A \subset X, \ \mathrm{diam}(A) < \delta_L \implies A \subseteq U_\alpha \text{ for some } \alpha.$$

- Paracompact

- Components: Set $x \sim y$ iff there exists a connected set $U \ni x, y$ and take equivalence classes

- Path Components: Set $x \sim y$ iff there exists a path-connected set $U \ni x, y$ and take equivalence classes

2 Theorems

- Closed subsets of Hausdorff spaces are compact? (check)
- Cantor's intersection theorem?
- Tube lemma
- Properties pushed forward through continuous maps:
  - Compactness?
  - Connectedness (when surjective)
  - Separability
  - Density **only when** f is surjective
  - **Not** openness
  - **Not** closedness
- Results that only work for metric spaces
  - ?
- A retract of a Hausdroff/connected/compact space is closed/connected/compact respectively.
- A continuous function on a compact set is uniformly continuous.
  - Proof: take $\left\{ B_{\frac{\varepsilon}{2}}(y) \ \middle| \ y \in Y \right\} \rightrightarrows Y$, pull back to an open cover of X, has Lebesgue number $\delta_L > 0$, then $x' \in B_{\delta_L}(x) \implies f(x), f(x') \in B_{\frac{\varepsilon}{2}}(y)$ for some y.
- Lipschitz continuity implies uniform continuity (take $\delta = \varepsilon/C$)
  - Counterexample to converse: $f(x) = \sqrt{x}$ on $[0, 1]$ has unbounded derivative.
- Extreme Value Theorem: for $f : X \longrightarrow Y$ continuous with X compact and Y ordered in the order topology, there exist points $c, d \in X$ such that $f(x) \in [f(c), f(d)]$ for every x.

3 Sandbox of Spaces

- Finite discrete sets with the discrete topology
- Subspaces of $\mathbb{R}$: $(a, b), (a, b], (a, \infty)$, etc.

  - $\{0\} \bigcup \left\{ \dfrac{1}{n} \;\middle|\; n \in \mathbb{Z}^{\geq 1} \right\}$

- $\mathbb{Q}$
- The topologist's sine curve

Alternative topologies to consider:

- Cofinite
- Discrete and Indiscrete
-

4 General Topology

4.1 2

Statement: state the definition of compactness, determine if the sets $\{0\} \bigcup \left\{ \dfrac{1}{n} \right\}, (0, 1]$ are compact.

i. A topological space (X, τ) is **compact** if every open cover has a *finite* subcover. That is, if $\left\{ U_j \;\middle|\; j \in J \right\} \subset \tau$ is a collection of open sets such that $X \subseteq \bigcup_{j \in J} U_j$, then there exists a *finite* subset $J' \subset J$ such that $X \subseteq \bigcup_{j \in J'} U_j$.

ii. Use Heine-Borel theorem: a set $U \subset \mathbb{R}^n$ is compact $\iff$ U is *closed* and *bounded*.

- X is closed in $\mathbb{R}$, since we can write its complement as an arbitrary union of open intervals:

$$X^c = (-\infty, 0) \bigcup \left(\bigcup_{n \in \mathbb{Z}^+} \left(\frac{1}{n}, \frac{1}{n+1} \right) \right) \bigcup (1, \infty)$$

- X is *bounded*, since we can pick $r = 1$, then $x, y \in X \implies d(x, y) \leq r = 1$.

iii. Use Heine-Borel again: X is not closed because it does not contain all of its limit points, e.g. the sequence $\left\{ x_n := \dfrac{1}{n} \;\middle|\; n \in \mathbb{Z}^{\geq 1} \right\} \subset X$ but $x_n \overset{n \to \infty}{\longrightarrow} 0 \in X^c$. Thus is is **not** compact.

4.1.1 Alternate Proof of (ii)

See Munkres p.164

- Let $\left\{ U_i \;\middle|\; j \in J \right\} \rightrightarrows X$; then $0 \in U_j$ for some $j \in J$.
- In the subspace topology, U_i is given by some $V \in \tau(\mathbb{R})$ such that $V \bigcap X = U_i$
  - A basis for the subspace topology on $\mathbb{R}$ is open intervals, so write V as a union of open intervals $V = \bigcup_{k \in K} I_k$.

– Since $0 \in U_j$, $0 \in I_k$ for some k.

- Since I_k is an interval, it contains infinitely many points of the form $x_n = \dfrac{1}{n} \in X$
- Then $I_k \bigcap X \subset U_j$ contains infinitely many such points.
- So there are only *finitely* many points in $X \setminus U_j$, each of which is in $U_{j(n)}$ for some $j(n) \in J$ depending on n.
- So U_j and the *finitely* many $U_{j(n)}$ form a finite subcover of X. ∎

4.2 4

Statement: show that the *Lebesgue number* is well-defined for compact metric spaces.

Note: this is a question about the *Lebesgue Number*. See Wikipedia for detailed proof.

- Write $U = \Big\{ U_i \ \Big| \ i \in I \Big\}$, then $X \subseteq \bigcup\limits_{i \in I} U_i$. Need to construct a $\delta > 0$.
- By compactness of X, choose a finite subcover $U_1, \cdots, U_n$.
- Define the distance between a point x and a set $Y \subset X$: $d(x, Y) = \inf\limits_{y \in Y} d(x, y)$.

  – **Claim**: the function $d(\,\cdot\,, Y) : X \longrightarrow \mathbb{R}$ is continuous for a fixed set.
  – Proof: Todo, not obvious.
- Define a function

$$f : X \longrightarrow \mathbb{R}$$

$$x \mapsto \frac{1}{n} \sum_{i=1}^{n} d(x, X \setminus U_i).$$

  - Note this is a sum of continuous functions and thus continuous.
- **Claim**:

$$\delta := \inf_{x \in X} f(x) = \min_{x \in X} f(x) = f(x_{\min}) > 0$$

suffices.
  - That the infimum is a minimum: f is a continuous function on a compact set, apply the extreme value theorem: it attains its minimum.
  - That $\delta > 0$: otherwise, $\delta = 0 \implies \exists x_0$ such that $d(x_0, X \setminus U_i) = 0$ for all i.
    * Forces $x_0 \in X \setminus U_i$ for all i, but $X \setminus \bigcup U_i = \emptyset$ since the U_i cover X.
  - That it satisfies the Lebesgue condition:

$$\forall x \in X, \exists i \quad \text{such that} \quad B_\delta(x) \subset U_i$$

    * Let $B_\delta(x) \ni x$; then by minimality $f(x) \geq \delta$.
    * Thus it can *not* be the case that $d(x, X \setminus U_i) < \delta$ for *every* i, otherwise

$$f(x) \leq \frac{1}{n}(\delta + \cdots + \delta) = \frac{n\delta}{n} = \delta$$

    * So there is some particular i such that $d(x, X \setminus U_i) \geq \delta$.
    * But then $B_\delta \subseteq U_i$ as desired.

4.3 6

Statement: prove that $[0, 1] \subset \mathbb{R}$ is compact.

4.3.1 Proof 1 (DZG)

Todo: find a direct proof.

4.4 8

Topic: proof of the tube lemma.

Statement: show $X, Y \in \text{Top}_{\text{compact}} \iff X \times Y \in \text{Top}_{\text{compact}}$

4.4.1 Proof 1 (DZG)

$\impliedby$:

- By universal properties, the product $X \times Y$ is equipped with continuous projections
- The continuous image of a compact set is compact, and $\pi_1(X \times Y) = X, p_2(X \times Y) = Y$
- So X, Y are compact.

$\implies$:

Proof of Tube Lemma:

- Let $\left\{ U_j \times V_j \mid j \in J \right\} \rightrightarrows X \times Y$.
- Fix a point $x_0 \in X$, then $\{x_0\} \times Y \subset N$ for some open set N.
- By the tube lemma, there is a $U^x \subset X$ such that the tube $U^x \times Y \subset N$.
- Since $\{x_0\} \times Y \cong Y$ which is compact, there is a finite subcover $\left\{ U_j \times V_j \mid j \leq n \right\} \rightrightarrows \{x_0\} \times Y$.
- "Integrate the X": write

$$W = \bigcap_{j=1}^{n} U_j,$$

  then $x_0 \in W$ and W is a finite intersection of open sets and thus open.
- Claim: $\left\{ U_j \times V_j \mid j \leq n \right\} \rightrightarrows W \times Y$
  - Let $(x, y) \in W \times Y$; want to show $(x, y) \in U_j \times V_j$ for some $j \leq n$.
  - Then $(x_0, y) \in \{x_0\} \times Y$ is on the same horizontal line
  - $(x_0, y) \in U_j \times V_j$ for some j by construction
  - So $y \in V_j$ for this j
  - Since $x \in W$, $x \in U_j$ for *every* j, thus $x \in U_j$.
  - So $(x, y) \in U_j \times V_j$

Actual Proof:

- Let $\left\{ U_j \mid j \in J \right\} \rightrightarrows X \times Y$.
- Fix $x_0 \in X$, the slice $\{x_0\} \times Y$ is compact and can be covered by finitely many elements $\left\{ U_j \mid j \leq m \right\} \rightrightarrows \{x_0\} \times Y$.
  - Sum: write $N = \bigcup_{j=1}^{m} U_j$; then $\{x_0\} \times Y \subset N$.
  - Apply the tube lemma to N: produce $\{x_0\} \times Y \in W \times Y \subset N$; then $\left\{ U_j \mid j \leq m \right\} \rightrightarrows W \times Y$.
- Now let $x \in X$ vary: for each $x \in X$, produce $W_x \times Y$ as above, then $\left\{ W_x \times Y \mid x \in X \right\} \rightrightarrows X$.
  - By above argument, every tube $W_x \times Y$ can be covered by *finitely* many U_j.
- Since $\left\{ W_x \mid x \in X \right\} \rightrightarrows X$ and X is compact, produce a finite subset $\left\{ W_k \mid k \leq m' \right\} \rightrightarrows X$.
- Then $\left\{ W_k \times Y \mid k \leq m' \right\} \rightrightarrows X \times Y$; the claim is that it is a finite cover.
  - Finitely many k
  - For each k, the tube $W_k \times Y$ is covered by finitely by U_j
  - And finite $\times$ finite = finite. ∎

Shorter mnemonic:

19.U It is sufficient to consider a cover consisting of elementary sets. Since Y is compact, each fiber $x \times Y$ has a finite subcovering $\{U_i^x \times V_i^x\}$. Put $W^x = \cap U_i^x$. Since X is compact, the cover $\{W^x\}_{x \in X}$ has a finite subcovering W^{x_j}. Then $\{U_i^{x_j} \times V_i^{x_j}\}$ is the required finite subcovering.

5 10

X is connected:

- Write $X = L \coprod G$ where $L = \{0\} \times [-1, 1]$ and $G = \left\{ \Gamma(\sin(x)) \mid x \in (0, 1] \right\}$ is the graph of $\sin(x)$.
- $L \cong [0, 1]$ which is connected
  - Claim: Every interval is connected (todo)
- Claim: G is connected
  - The function

$$f : (0, 1] \longrightarrow [-1, 1]$$
$$x \mapsto \sin(x)$$

  is continuous (how to prove?)
  - Claim: The diagonal map $\Delta : Y \longrightarrow Y \times Y$ where $\Delta(t) = (t, t)$ is continuous for any Y since $\Delta = (\mathrm{id}, \mathrm{id})$
  - The composition of continuous function is continuous
  - So the composition is continuous:

$$F : (0, 1] \xrightarrow{\Delta} (0, 1]^2 \xrightarrow{(\mathrm{id}, f)} (0, 1] \times [-1, 1]$$
$$t \mapsto (t, t) \mapsto (t, f(t))$$

  - Then $G = F((0, 1])$ is the continuous image of a connected set and thus connected.
- Claim: X is connected
  - Suppose there is a disconnecting cover $X = A \coprod B$ such that $\overline{A} \bigcap B = A \bigcap \overline{B} = \emptyset$ and $A, B \neq \emptyset$.
  - WLOG suppose $(x, \sin(x)) \in B$ for $x > 0$.
  - Claim: $B = G$
    * It can't be the case that A intersects G: otherwise $X = A \coprod B \implies G = (A \bigcap G) \coprod (B \bigcap V)$ disconnects G. So $A \bigcap G = \emptyset$, forcing $A \subseteq L$
    * Similarly L can not be disconnected, so $B \bigcap L = \emptyset$ forcing $B \subset G$
    * So $A \subset L$ and $B \subset G$, and since $X = A \coprod B$, this forces $A = L$ and $B = G$.
  - But any open set U in the subspace topology $L \subset \mathbb{R}^2$ (generated by open balls) containing $(0, 0) \in L$ is the restriction of a ball $V \subset \mathbb{R}^2$ of positive radius $r > 0$, i.e. $U = V \bigcap X$.
    * But any such ball contains points of G: namely take n large enough such that $\frac{1}{n\pi} < r$.
    * So $U \bigcap L \bigcap G \neq \emptyset$, contradicting $L \bigcap G = \emptyset$.

6 12

- Using the fact that $[0, \infty) \subset \mathbb{R}$ is Hausdorff, any retract must be closed, so any closed interval $[\varepsilon, N]$ for $0 \leq \varepsilon \leq N \leq \infty$.
  - Note that $\varepsilon = N$ yields all one point sets $\{x_0\}$ for $x_0 \geq 0$.
- No finite discrete sets occur, since the retract of a connected set is connected.
- ?

7 14

- Take two connected sets X, Y; then there exists $p \in X \bigcap Y$.
- Write $X \bigcup Y = A \coprod B$ with both $A, B \subset A \coprod B$ open.
- Since $p \in X \bigcup Y = A \coprod B$, WLOG $p \in A$. We will show B must be empty.
- Claim: $A \bigcap X$ is clopen in X.
    - $A \bigcap X$ is open in X: ?
    - $A \bigcap X$ is closed in X: ?
- The only clopen sets of a connected set are empty or the entire thing, and since $p \in A$, we must have $A \bigcap X = X$.
- By the same argument, $A \bigcap Y = Y$.
- So $A \bigcap \left(X \bigcup Y \right) = \left(A \bigcap X \right) \bigcup \left(A \bigcap Y \right) = X \bigcup Y$
- Since $A \subset X \bigcup Y$, $A \bigcap \left(X \bigcup Y \right) = A$
- Thus $A = X \bigcup Y$, forcing $B = \emptyset$.

8 16

> Topic: closure and connectedness in the subspace topology. See Munkres p.148

- $S \subset X$ is **not** connected if S with the subspace topology is not connected.
    - I.e. there exist $A, B \subset S$ such that
        * $A, B \neq \emptyset$,
        * $A \bigcap B = \emptyset$,
        * $A \coprod B = S$.
- Or equivalently, there exists a nontrivial $A \subset S$ that is clopen in S.

Show stronger statement: this is an iff.

$\Longrightarrow$:

- Suppose S is not connected; we then have sets $A \bigcup B = S$ from above and it suffices to show $\mathrm{cl}_Y(A) \bigcap B = A \bigcap \mathrm{cl}_X(B) = \emptyset$.
- A is open by assumption and $Y \setminus A = B$ is closed in Y, so A is clopen.
- Write $\mathrm{cl}_Y(A) := \mathrm{cl}_X(A) \bigcap Y$.
- Since A is closed in Y, $A = \mathrm{cl}_Y(A)$ by definition, so $A = \mathrm{cl}_Y(A) = \mathrm{cl}_X(A) \bigcap Y$.
- Since $A \bigcap B = \emptyset$, we then have $\mathrm{cl}_Y(A) \bigcap B = \emptyset$.
- The same argument applies to B, so $\mathrm{cl}_Y(B) \bigcap A = \emptyset$.
$\Longleftarrow$:

- Suppose displayed condition holds; given such A, B we will show they are clopen in Y.
- Since $\mathrm{cl}_Y(A) \bigcap B = \emptyset$, (claim) we have $\mathrm{cl}_Y(A) = A$ and thus A is closed in Y.

– Why?

$$\mathrm{cl}_Y(A) := \mathrm{cl}_X(A) \bigcap Y$$
$$= \mathrm{cl}_X(A) \bigcap \left(A \coprod B \right)$$
$$= \left(\mathrm{cl}_X(A) \bigcap A \right) \coprod \left(\mathrm{cl}_X(A) \bigcap B \right)$$
$$= A \coprod \left(\mathrm{cl}_X(A) \bigcap B \right) \quad \text{since } A \subset \mathrm{cl}_Y(A)$$
$$= A \coprod \left(\mathrm{cl}_Y(A) \bigcap B \right) \quad \text{since } B \subset Y$$
$$= A \coprod \emptyset \quad \text{using the assumption}$$
$$= A.$$

- But $A = Y \setminus B$ where B is closed, so A is open and thus a nontrivial clopen subset.

■

Y

cl(Y)

8.1 18

- Define a new function

$$g : X \longrightarrow \mathbb{R}$$
$$x \mapsto d_X(x, f(x)).$$

- Attempt to minimize. Claim: g is a continuous function.

- Given claim, a continuous function on a compact space attains its infimum, so set

$$m := \inf_{x \in X} g(x)$$

and produce $x_0 \in X$ such that $g(x) = m$.

- Then

$$m > 0 \iff d(x_0, f(x_0)) > 0 \iff x_0 \neq f(x_0).$$

- Now apply f and use the assumption that f is a contraction to contradict minimality of m:

$$\begin{aligned} d(f(f(x_0)), f(x_0)) &\leq C \cdot d(f(x_0), x_0) \\ &< d(f(x_0), x_0) \quad \text{since } C < 1 \\ &\leq m \end{aligned}$$

- Proof that g is continuous: use the definition of g, the triangle inequality, and that f is a contraction:

$$\begin{aligned} d(x, f(x)) &\leq d(x, y) + d(y, f(y)) + d(f(x), f(y)) \\ \implies d(x, f(x)) - d(y, f(y)) &\leq d(x, y) + d(f(x), f(y)) \\ \implies g(x) - g(y) &\leq d(x, y) + C \cdot d(x, y) = (C + 1) \cdot d(x, y) \end{aligned}$$

  - This shows that g is Lipschitz continuous with constant $C + 1$ (implies uniformly continuous, but not used).

8.2 20

See definitions in intro.
